Wow! different strokes for different folks! I'm too warm up here in
Pennsylvania. I spent some time in Fla during a normal summer, and I
though I was going to die at any moment. The folks I stayed with didn't
use air conditioning. Maybe I'll move to Alaska when I retire.

I live for the winter!

My analysis of the few switchers from PCs is that
the windings are
about 4V/turn. This assumes one takes the center
point of the mains caps
as the primary voltage switched. 42 to 44 turns, I
counted.
The secondary seems to have plenty of lee-way in
voltage range
on the assumption that on full load only will it
be a 50% duty
cycle. I'm sure someone will correct me it I'm
wrong! :-)

Cheers

Hi,
I just got a PA-10 at a hamfest, Ramsey was nice enough to mail me a copy of the manual for it, but seems to be missing a page.

It says the PA-10 is easily configured to other bands, but not how to do so. Would this include 6 meter and if so what would be involved?
Thanks

I have seen a number of ideas for 80M AM using a switching FETs which are pretty cheap.
You could do drain modulation using a switch mode PWM setup - this is how commercial transmitters work nowadays so I understand. It would need some filtering after the modulator

I have thought about doing this a few times but have never got around to it....

Source record: 33066

This is my first visit to this newsgroup...I am a new MI3.

I would like to put together a very simple QRP CW transceiver. The schematic I am using includes a 3.560MHz crystal oscillator.

Maplin's, Farnell etc. sell 3.579545MHz or 3.686400MHZ crystal oscillators respectively and I am wodering will these do the job or should I be looking for a 3.560MHz crstal? The circuit does have a 65pF trimmer capacitor for tuning but I want to sure about the crystal before I order.

Thanks for your help.

Chris

(without seeing the schematic I can't know for sure but...)

I doubt the trimmer capacitor will be able to "warp" the frequency from
3.579545 to 3.560. I would be *certain* you won't be able to warp it
from 3.6864 to 3.560. I would expect more like maybe at most 5KHz
(3.579545=>3.574).

I wouldn't think that would be a big problem though, with regard to
3.579. You'll just be operating on 3.579 instead of 3.560. (you do
need to double-check and make sure your license allows operation on the
higher frequency but I'd be VERY surprised if it doesn't.)

3.686400 will work from a technical standpoint too. However, I think
that frequency is in the phone band in Europe so it might not be a
suitable choice for a CW transceiver.

Alternatively you could consider getting a 3.58 MHz ceramic resonator. It is pullable from about 3.50 to 3.60 MHz and might even cost less.

Message-ID: <vkhsopcg5oe734@corp.supernews.com>
Source record: 33069

I need a pinout for the microphone connector on my KDK FM-2033. It has the same connector as the FM-2030, the FM-4033 and the FM-7033, as well as, possibly, the FM-2016. It is a screw-on connector with 6 pins. There is one pin in the center, with five others at various points surrounding it, and there is a notch at the bottom. The microphone unit has the female connector, the one on the radio is male.

Anybody got a similar connector with a pinout for it?
Thanks!

-Greg Courville

Have a look at

http://www.part15.org/mwa/tech/circuits/poppet.html

Although for 160m, it is easy to retune it for 80m. I've just built one
without any real problems. Low power, but I'm now working on the linear!

Hi,

I have a PA-10 with complete manual, from what I read, the "other Bands"
refer to the business Freq. located above/below 2 Mtr.
For 6mtr. it is time for a re-design, as in coils, caps., ect...

I have thought, of getting a kit for their HF amp, and re-do the thing for
my FT-817, however I have had so much fun working QRP during band openings,
I never did anything...

From: Greg Courville <EngNOSPAMinuitor@Gee-Enginuity.com>
Message-ID: <vkitnuk039ie04@corp.supernews.com>
Source record: 33072

I have figured out the pinout by taking apart my handset. Here it is:

*-Down button (12V to activate)

*-Up button (12V to
activate)
* -PTT line (ground to transmit)
* -GND

*-Mic-level audio *-12V power (regulated to 5V inside
handset)

(looking at the male connector on the radio)

Sorry if that's hard to see. The asterisks represent the pins on the male
connector.
Hope this helps anyone else who's looking for it!

Try to find a ceramic resonator 3.58 MHz instead.
Its much cheaper. And you can tune it much wider.And its very stable.
I can tune mine from 3.5 to 3.6 MHz with a adj. aircapacitor in serie (ca
ca 100pF).
It was a little tricky to find a schematic for it to oscillate with my
junkbox-components.
I dont use a sinus oscillator but a square-wave . So perhaps its
not tricky to get a sinus osc. to work.
The companys manuf. these (for ex. Murata) have schematic diagrams
on there homepage I think.
But try to find schematic diagrams on QRP-pages on the net.

Putting two of the same freq. crystals in parallel increases the tuning
range considerably.

The soldering iron, P/N TC201, for the subject station has burned out. The heating element is P/N TC208 with pigtail leads. A local supplier has told me that it cannot be obtained any more and another supplier that I found on line told me that they had them back ordered with an ETA of 01/31/03 so I think that they can't get them anymore either.

Does anyone know of a source?

If there is none, can anyone verify that the newer soldering iron, P/N TC201T, can be used with the older power supply? It sure looks like it can.

Thanks es 73, CJ K0CJ

Mouser www.mouser.com stocks the TC201T iron and repair parts for it. I
don't know the difference between the WTCPN station and the WTCPT station
that Mouser lists in their current catalog (page 1027), but if the TC210T
iron is interchangeable with the TC210, then that's the place to go.
Cheers!!!

I suppose the newer iron is the one with the plug. I have both the
oooooold version and a couple newer ones, and the irons in all of them
are 24V 2A. Since all the control is in the iron itself, you should
be fine with the newer version.

You might be able to find a surplus station for less than a new
replacement iron will cost, though there is some advantage to having a
new iron with new cord and new thermal switch.

Cheers,
Tom

Clair -

I have already answered this for you directly. The TC208 "sired-in" heater used in the original TCP-1 irons and early version of the WTCPN station are still available from Weller. Wassco (California) is a very good Weller distributor -- takes about 2 weeks - since they do not stock the wired in heater.

The TC201P and TC201T irons (that use the newer plug-in heater) will work with the TC202 base.

There is a simple way to do that automatically. Find a relay
whose dropout voltage equals the voltage you want to discharge
the battery to. Discharge the battery through the relay coil and
the normally open point on the relay. You'll need to operate
the relay manually or via an external power source to start
the discharge cycle. When the battery discharges to the dropout
voltage, the relay drops and all current flow stops.

Do you mean this? (My attempt to understand your diagram)

1
2 3
4
5 6

1 = Down button (12V to activate)
2 = PTT line (ground to transmit)
3 = Up button (12V to activate)
4 = GND
5 = Mic-level audio
6 = 12V power (regulated to 5V inside handset)

Run the power to an old style electric clock or an analog
battery-powered clock through another set of contacts, and you've also
got the time it took.

All you've gotta do is find the relay. . .

Hi all,

> Putting two of the same freq. crystals in parallel increases the tuning
> range considerably.
See http://www.norcalqrp.com/nb6m/contestvxos/VXOExperiments.htm for
more info.
Or try to use a once-programmable oscillator Epson SG8002, which
will provide you any exact (per several Hz) frequency between 1MHz and
125MHz, square wave of course. See
http://www.hw.cz/english/docs/oscillators/epson_sg8002.html .

You could use a ceramic resonator but you might need a different circuit.

Either of the crystals you mention will work. However as mentioned by another poster 3.6864 isn't in the CW part of the band. Personally to avoid dissappointment I'd advise against 3.579 too: there isn't much activity there. 3.560 is the standard QRP calling frequency and there's plenty of activity there. You can get 3.560 crystals, try http://www.jabdog.com/crystals.htm amongst others.

Alternatively you can get use a 3.579 crystal and modify it down to 3.560. See this page on my web site for details http://www.hanssummers.com/radio/penning/index.htm.

My first radio as a kid in the mid-1960s was one my father bought for me -- a Lafayette Explor-Air kit radio. He built it, and I used it well. It was a three-tube regenerative unit for AM and three SW bands. It was Lafayette model KT-135, and it looked like this: http://hometown.aol.com/kc0imn/explorair.jpg

Osterman prices it $25-35 (Shortwave Receivers Past & Present, p. 255). There's another pic there as well for those who have the book.

I would very much like to acquire one unit, working if possible (although I would be happy to acquire one even if not), to present to my father at an anniversary event in December 2003. I will pay $100 plus shipping to anyone who has one they're willing to unload.

Thanks very much!

Have you looked around the internet? There are a few sites that have
some basic circuits that should help.

Try:
http://my.integritynet.com.au/purdic/
This site has beginner and advanced information on various projects.

Try:
http://users.forthnet.gr/rho/billpatric/circuits1.htm
It has what looks like Rusian headings but most if not all the links
are english.

A friend of mine in Paris is running an electronics class on Saturday mornings at his kids' school; I was staying with him and helped out at the first session. He has started them from scratch - switches, light bulbs, resistors, ...

The main thing is to get them doing things for themselves, as much as possible, otherwise they will get bored. Use analogue meters and batteries. Have them work in pairs/threes. Have a good selection of different components - old-fashioned salvaged ones are fine, and can be obtained free.

I would think commercial kits would tend to have a price that when multiplied
by a classroom would be quite costly. An individual paying $20 might
not find that too costly, but what they'd really be paying for is whatever
instructions come with the kit.

If you can scrounge parts, likely the cost will be low or zero, though
there it will require time, to do the scrounging and to test the parts.
Though, that could be part of the assembly process, so instead of
detailing how the kids should assemble the parts, you'd start with
using a DVM to check the diode and/or transistor.

There isn't much in a crystal radio. Some sort of tube, wound with
wire, A variable capacitor would be nice, but that's going to be costly
if buying new. A fixed capacitor would get some results. A germanium
diode would be the best choice for the detector (unless you actually
build cat's whiskers, but that likely would increase cost), and they
won't cost much, but you may have to look to find them. The biggest problem
will be headphones that will have enough impedance to work well with the
detector. Though there have been workarounds suggested in recent years
in the magazines, such as transformers, and even IC amplifiers working
merely for impedance matching rather than outright gain.

Make it a scavenger hunt, and each kid needs to bring in a junk
transistor radio, which will offer up a variable capacitor. Either they'd
have one just sitting around at home, or they could get one for a dollar
or so. The advantage of them scrounging is that you won't have to
buy thirty radios at different garage sales or rummage sales.

Charles Kitchin has written quite a few articles in the past decade
about renerative receivers. Some have been intended for the beginner.
Except for the variable capacitor, they have all been common parts (and

I think he might have used a varicap in one, which likely is cheaper
than buying a new variable capacitor). The local surplus outlet was
selling 99cent boards, some sort of game I think it was originally,
that would have offered up most of the parts for one of his regens.
Common bipolar transistors, some bypass capacitors, an audio amplifier
(though not the one he used), some diodes, and maybe some of the resistors.
But a lot of junked consumer equipment would provide most of the parts.
He even used a 35mm film canister for his coil form, and those can
be had by visiting a friendly photo shop.

A regen requires more parts, and of course requires more assembly work,
but it just might come in cheaper than buying parts for a crystal radio.

Lots of good ideas have been posted here.

Someone in the International Technology Education Association
http://www.iteawww.org/
might have already solved the problem. There are vendors of educational kits just for the classroom. My home was previously occupied by a tech ed teacher and for the first year I got some of his catalogs.

I think it is interesting that on the ITEA website I could find no mention of ham radio or the ARRL. Wonder why?

We sent the following information to all ARRL affiliated clubs within a 100 mile radius. That is 17 clubs plus Betty w5pup:

The Highland Lakes Amateur Radio Club is hosting its Third Annual Free Swap Meet Saturday morning September 6th. The meet will be held at the "Lakeside Pavilion" in Marble Falls. (The Burnet site we used the past two years is no longer available.)

We think the Pavilion will be a good location for the Swap Meet; it's located on the north bank of Lake Marble Falls, a short distance West of the Hw 281 bridge. It has a roof that covers more than 5000 sq., electrical outlets, restrooms, and 30 tables that will be available on a first-come-first-serve basis. We expect to have enough chairs to meet everyone's needs but if you are not going to arrive early it might be advisable to bring your own table. Tailgaters will be welcome to set up in the parking but no spaces will be reserved. The City has regulations pertaining to alcohol and firearms on park property so we ask that neither be brought to the Pavilion.

Our Club VEs are scheduling license exams on site at 11am. If you have any questions about the exams please contact Don Graves and dgraves@tstar.net

We hope to attract a good crowd and would appreciate any help you can give us getting word out to Hams in your area.

More information on the Meet is posted on the clubs website: www.hlarc.org

A talk-in station will be manned on 146.660(-) with access tone 88.5.

DIRECTIONS: From Hw 281 turn west onto 1st St., then TURN LEFT at the first intersection (Ave. H), proceed south to the first Stop Sign, then TURN RIGHT, you will pass a boat ramp, a tennis court and a swimming pool. The Pavilion is a large structure located just past the swimming pool.

I enjoy fixing up transceivers that are 'beyond practical repair.' If you have something that no longer works, that you will part with for a reasonable price, please let me know.

I am interested in HF, VHF, and UHF transceivers of any age up to, say, 15 years old as long as they aren't messed up cosmetically and aren't missing any important components. Kenwood, Alinco, and ICOM are brands of interest, for instance.

Recently I have solved some tough problems with radios and I feel that I am on a roll.

1487. No QRP transistors on Ebay?

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-08-27 19:50:12 UTC
From: snarflemike@yahoo.com
Message-ID: <20619edc.0308271150.18ab03ec@posting.google.com>
Source record: 33004

Caution: this may be the most unimportant post you read today (or this month, or this year, or...)

Anyway, I haven't been in the market for QRP-level transistors for a long time, having laid in a lifetime's supply years ago, but today just for fun I searched for some of the usual suspects from the past (2N3553, 2N3866, 2N4427, MRF237, 2N5109, 2SC799, etc) on Ebay and found almost nothing to be had. This greatly surprised me, as I was expecting to find all of my old friends readily available. So, are the "old standards" really hard to find now, or are they still readily available (outside of Ebay), or what???

I have to mention the irony that I am able to find any vacuum tube I could possibly want on Ebay, including dozens of types that would make excellent QRP finals, from a seemingly unlimited number of sellers! :-)

73,
Mike, KK6GM

Do a web search for the part number, and you'll get quite a few hits showing sites that have them for sale.

I fail to see why selling these repaired radios is a problem? If it
is, then they can keep the rigs that are "beyond practical repair" for
paper-weights.

If you have a parts distributor nearby that stocks (or can order the
Mode line) you might find their variants marginally cheaper:

http://www.mode-elec.com/Products/Page_44-46.pdf

Distributor list here:

http://www.mode-elec.com/Distributors/distributors.html

Cheers,

Well, as a start it is generally assumed that an LED when under
forward bias and lit up has 2V across it with 20mA flowing through it.
This allows you to calculate a series resistor with any applied voltage.
Does this help? Any other questions?

Those devices don't seem to be manufactured any more. I checked a couple of
manufacturers' web sites a couple of weeks ago and couldn't find them. One
or two suppliers here in the UK still stock them, but they are quite
expensive.

I recently had to look for something similar. A current part might
be the NEC (CEL) NE46134... It is probably a little faster than parts
like the 2N3866, and also is lower voltage, but for a new design might
be somewhat useful (and current.)

The BF959 (On Semi, plastic) should be quite useful for broadband pre-amps
instead of the 2N5109 - 500 MHz ft and 1W max. It's a bit noisier, though.
I recently bought some.

Source record: 33016

The advice about current is a good one. Be particularly watchful of the specs on odd colored LEDs. White and Blue LEDs often require more voltage to begin emitting. Many of the brighter LEDs will draw somewhat more current.

If you are limiting the current with a simple series resistor, presume the LED will drop the specification voltage, and select the resistor to drop the remainder of the voltage at the specification current. The problem with this approach is that you often end up dropping a bunch of volts, and so you can dissapate a lot of power in the resistor. It can be a little startling to see a little LED fry a resistor.

Unlike incandescent lamps, which fail abruptly, an LED has a half-life which is dependent (in a very non-linear way) on the current. A typical LED, run at the manufacturer's specs, will loose half it's intensity after about 5 years of on time. Decreasing the current will improve this somewhat, but not a lot. On the other hand, increasing the current will shorten the life a lot. There is a sort of avalange effect where a little too much current will quickly fry the LED. It can be quite surprising how much current an LED can suck up, for a short period of time(!).

When you are close to the specification current, changing the current a little one way or the other doesn't seem to affect the output all that much. This is handy if you are concerned, for example, with battery life. By sacrificing a little light output you can often save quite a bit of current.

..

The best tutorials are on Agilent's website. For controllers, National Semi and Linear Tech have very interesting articles.

One thing which I will point out is that each LED (generally) needs its own current limiting resistor. Don't try to parallel LEDs with only one current limiting resistor.

LED brightness is also affected by ambient temperature.

Lastly, there are some good current regulation circuits out there -- LEDs can be used in densitometric (where you need 60+dB of linear performance) applications if you tightly control the current.

Your advice is on the mark. I've gotten to the point where I *never*
spell out an entire word or part number on ebay! Hint to hams: lots
of sellers can't spell "amateur" :-)

I dont' have any 'lists' per-se, but you might want to look at
www.cel.com (for the US rep and info for NEC transistors.) philips
and siemens (infineon.com) also have a current line of RF components.
For slightly higher frequencies, the agilent phemts are actually
really practical for as low as 50MHz (but probably 200MHz in reality.)
For RF gain modules, the sirenza (sp) parts are really good (and
in some cases, the original OEM for the Minicircuits gain parts.)
(Their SiGe parts are usually reasonably priced, have low NF as low
as 1.9dB, and SiGe parts tend to have good low frequency NF also.)

The manufacturers that I listed above tend to have fairly good
spec sheets and have SOME US availability. Often, there
is the terrible issue of QTY3000 type order requirements, but
that isn't always a problem.

For distributors, you can try mouser.com, newark.com, avnet.com?, etc.

Mouser has a fairly good stock, and so does newark... Sometimes, the
distributors have 'good deals' on designers kits. The designers kits
usually have anywhere from QTY3 per part number on up to QTY10 or higher.

I usually play the game of looking at the suppliers spec sheets, and
the distributor's availability lists, and then compare the two.

(I know that this isn't directly answering your need/questions, but can
get you started if no other info is provided to you!!!)

John

Unfortunately, the file does not seem to be available currently. I found
the link for it
(http://www.analog.com/UploadedFiles/Tutorials/104002517DDStutor.pdf), but
it takes you to a "not found" page.

The 1st link under "Technical Documentation" doesn't work.
The one under Tutorials (right at the bottom) does work :

1508. Newbie Question - Class C Amplifiers

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-08-29 00:51:07 UTC
From: Bruce Raymond <raymondb@dma.org>
Message-ID: <%rx3b.35343$Vx2.15393021@newssvr28.news.prodigy.com>
Source record: 33025

I've seen the equation Po = V^2 / 2R applied to the design
of Class C amplifiers. This doesn't make sense to me and
I'm looking for corroboration, or somebody to tell me I'm
an idiot ;-). The formula makes sense for a Class A amplifier
which has conduction over 360 degrees, but would seem
to overstate the power output for a Class C amplifier with,
say a 120 degree conduction.

An amplifier with a 120 degree conduction angle would
only produce about 47% as much power as one with a
360 degree conduction angle (if I did the math right).
Therefore, I'm assuming that the formula should be
Po = .47 * V^2 / 2R, or Po = V^2 / 4.2R in this case.
Is this correct?

Thanks,
Bruce Raymond/ND8I

I think the answer depends on what the letter V stands for in the
equation. If it is the peak voltage of a sine wave that rings out of
a tuned circuit (or any other pretty good sine source), then it
doesn't matter how the sine wave was generated. Somehow, the energy
put into the resonator is driving a resistor with positive and
negative peak swings and that dumps
V^2 / 2R watts into the resistor. The instantaneous peak power put
into the resonance must be higher than that, for the class C amplifier
to pump it up to that voltage in a small fraction of a cycle.

If you want a challenge, figure the power out of a class C DC
amplifier. ;)

John,

Thanks for the reply. I'm actually interested in the version
of the formula (Rl = Vcc^2 / 2Pout) listed on page 2.33
of "Experimental Methods in RF Design", by Wes Hayward, ...
(excellent book).

In the example Vcc is 12 volts and Po is 1.5 watts. Rl
works out to 48 ohms. Wouldn't the peak current be
12 volts/48 ohms = 250 ma? If this were a sine wave then
the RMS power would be 1.5 watts. However, the amplifier
is run as Class C and only produces output less than half
of the time, so the output would then be less than 0.75 watts.

It seems that the formula should be adjusted to account
for the conduction angle, e.g. Rl should be smaller by at
least a factor of 2 to compensate for the conduction
angle. What am I missing?

Thanks,
Bruce Raymond/ND8I

More current is flowing thru the transistor when conducting than would normally be used if class-A ? ... this would average out because it's being pulsed rather than continuous.

As it's a tuned circuit, the tuned circuit would carry on dishing out current into the load thru the rest of the cycle - stored from the pulse of current when the transistor conducts.

You are missing the effect of the tuned circuit. Class C operation means
that the output transistor(s) are turned on for only part of a cycle and
thus feed energy into the tuned circuit during part of a cycle. However,
the energy stored in the tuned circuit is large enough to maintain the
output voltage through the complete cycle. Thus the formula does not
need to kow about the conduction angle.
Tink about puching a child on a swing. The person pushing is the output
transistor and the child on the swing the tuned circuit. The person
provides small pushes for a very short part of the complete swing cycle
but they do it at just the right times and the total energy in the
system (how high the child swings) builds up and the swing executes
complete cycles even though it is only pushed for a few degrees at the
back of its swing.
Brian.

The equation appears in Terman's _Radio Engineering_, where it's derived with what looks like a bit of hand-waving. However, a paper is referenced (Terman and Roake, "Calculation and Design of Class C Amplifiers", Proc. I.R.E., vol. 24, April, 1936) which apparently has more of an in-depth derivation. However, it appears to be depend somewhat on characteristics unique to vacuum tubes. I recall having a homework question in college that looked like it required a derivation of the formula, and I struggled for several hours before giving up. The professor told me that it was a somewhat emperical formula which couldn't be rigorously derived.

Anyway, in Terman there's a graph (fig. 7-29 in the Third Ed.) which does include the effect of conduction angle, but it's not immediately obvious how the formula would be affected.

The formula commonly seen isn't generally used to predict power output, but rather solved for R to give a nominal impedance that a class C amplifier with output power Po would like to see. It's a good starting point for designing output networks, but by no means universal. High-efficiency amplifiers I've designed do require a different impedance than predicted by the formula. For example, see Fig. 2.97 in _Experimental Methods in RF Design_. The impedance seen by the collector of that amplifier is about 18.7 + j8.5 ohms(*), while the formula would predict about 9 ohms. There are more comments about that in the book.

I'm not aware of any rigorous formula that can be used to precisely predict the optimum load impedance for a class C amplifier.

(*) I don't recall right off how much C the zener adds, but think it was around 30 pF. So that's what I used for the calculation. Note that the L values in the figure caption should be uH, not H and mH as shown.

And it's reasonable to expect higher current in the pulse than Ohm's
Law would give, because the pulse has a whole bunch of energy in
harmonics, for which the load impedance is lower (the load C reactance
being lower). Since the harmonic content of the pulse goes up as the
conduction angle gets smaller, it makes sense that the average current
through the whole cycle would be somewhat independent of conduction
angle.

Just don't ask me to prove it! ;-)

Yes, but to complete the analogy, as the pushing phase becomes
shorter, the more the energy that be provided during it. It's just the
same with Class C., the shorter conduction angle operation requires
higher peak current drive to work properly.

It's really tricky to do a frequency domain analysis on a waveform as distorted as the one appearing on a class C amplifier collector. Unless you're extremely careful and very aware of exactly what you're doing, results are likely to be very wrong. Among other things, you have to rigorously preserve phase information for each frequency. I personally think a time domain approach is much more likely to yield correct results, and this has been done. Search for papers by Sokal and Sokal about class E amplifiers. I believe Frederick Raab did a lot of the mathematical analysis, and published a number of papers on the topic. I'd be very skeptical of any frequency domain analysis, or even general intuitive arguments based solely on frequency domain considerations.

You'll probably find more references on class E amplifiers in _Experimental Methods_. Class E amplifiers are essentially class C amplifiers in which the output networks are carefully and rigorously designed (using time domain techniques) to maximize efficiency.

1522. WTB: Cliff Dweller Rotatable Dipoe Centre Antenna Section

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-08-30 02:48:54 UTC
From: Norm VE3CZI <ve3czi@arrl.net>
Message-ID: <qpU3b.3961$Pa1.177316@read1.cgocable.net>
Source record: 33039
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,rec.radio.swap

I have the End Coils & Control Box for the Cliff Dweller Antenna that was
Mfd in 1960's by New-Tronics.
The Model was CD-40-75. It was essentially a 40 & 75 Meter Rotatable
Dipole.
I need the centre Motor Assy and extended 10 ft extentions between the
Center Motor Assy and the End 40/75 Meter Coild Assy.
I got the parts I got from an Estate Sale, but the widow did not know
anything about a Centre Section...I have done some digging and have info
from Newtronics but is limited.
Any assistance would be appreciated...even close up pictures of the centre
section so I "may" be able to fabricate a similar assy would be appreciated
Thank You for your time....Norm

I guess this assumes that with a 12 volt supply, a resonant load could produce almost a 24 volt peak to peak sine wave. A fair approximation.

When the class C amplifier comes on, it sees an impedance a lot lower than the 48 ohms on the tank. The amp loads the tank with all the energy it will lose in the next cycle, but the tank meters this energy to the load in sinusoidal form. A piston in an internal combustion engine puts out more peak torque than the flywheel delivers to the transmission by the same mechanism. But the average power put out by the piston is the same as the the average power delivered by the flywheel to the transmission.

Energy storage in the tank.

6th grade is WAY too late to try to get them interested.

Back in the Dark Ages of the early 1960s, the Boy Scouts of America had an Arrowhead point on the Wolf badge for a crystal radio, and one on the Bear badge for a 1-tube regenerative receiver (complete with 1H4G tube and 90 V B-battery). Wolf badge was nominally 8 years old, Bear nominally 9.

Kids can be successfully hooked on electronics at 5 or 6. The old 12-in-1 or 18-in-1 or N-in-1 experimenters kits work WONDERFULLY for that kind of thing.

Ramsey Electronics used to sell a crystal radio kit. This is the standard starting place.

Dick, there's a BC221 on Ebay UK's Ham Radio list, selling later
today, current;y the bid is 12.50 UKP if you're interested.
Not mine I hasten to add.

No, can't say I have..... I do remember once when I had just got to work
and a line operator came into the lab complaining that he had blown the
fuse on a power supply. It was one of those twist on black cap ones, that
held the fuse inside it. Well, I pulled it out and without thinking just shoved
a new fuse in and wham! Ya! I'm up! That worked better that 10 cups of
coffee!

I'm glad you're OK. But that fuse-holder was mis-wired, with the
ac input on the outer ring rather than on the inner end connection.
Properly wired, a user won't be exposed to a dangerous hazard, as
we point out on page 328 of our book, The Art of Electronics.

Thanks,
- Win

The first couple years those radios were out you couldn't find them. I actually made a couple for myself. HOWEVER now they can be found abundantly at hamfests, just check with the big connector dealers (sorry no names come to mind) (possibly rainbow).

Yes, my fault & I should have got back to thank everyone for their input
to my BC221 query sooner than this. I've now got a set of small Bristol
wrenches on order from the US and I'll post an up date once they arrive
& I've had a chance to try & remove the grub screws (carefully).

Once again, thanks for all the suggestions & loan offers.

> Dick, you got a lot of helpful feedback on your question - yet no response
> from you.
>
> Don't you think a simple "thank you" would be in order?

I'm glad to see that others feel the same way I do about that. I
often respond to questions, and end up with no idea if my response was
helpful or not. "Thank yous" are nice, but feedback even without a
thank-you would also be welcome, just to know that we're not talking
into the wind. Also, an "I solved the problem (thus-and-such way)" is
helpful: we then know we don't have to write any more, and maybe we
learn another way to solve such a problem, or place to get such parts.
Sometimes the discussion is worthwhile even without the OP's
response, but I'd always like to see _something_ back from the OP.

Welcome to bash me unmercifully if I fail to follow up like that on
any question I post!

Cheers,
Tom

Hi all,

I am trying to build a device that plugs in any fixed telephone and transmits the voice conversation to a Bluetooth headset (as it happens currently with the Bluetooth mobile phones).

Is there anyone out there interested to help me?
I have more or less designed the circuitry but I am stuck in the embedded programming of the microchip.

Anybody with electronic/programming knowledge is welcomed.

Regards,

George

1533. PLL filter problem

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-08-30 18:39:38 UTC
From: Damien Teney <damien.teney@sobelairva.net>
Message-ID: <biqr9edbv1@reader08.wxs.nl>
Source record: 32899

Hello all,
I 've built PLL in order to command the VCO of a VHF receiver. Unfortunately it doesn't work very well: the VCO output is on average equal the same as the frequency programmed in the PLL, but it is constantly varying a bit around it. I guess the problem comes from the output filter, but I've re-calculated it and it should be okay. Where could the problem come from ??

FYI, the PLL is build from a schematic of the Motorola application note 980 (http://www.mcarsweb.com/_divers/schematic_from_motorola_application-note_980.gif).

Thank you in advance for your answers ;-)

The incoming hot wire is not supposed to go to the center pin. That
way, the fuse isn't hot when it's inserted into the socket.

We need some more information.

What is the tuning sensitivity of the VCO in MHz/volt ?

What are the values for the divide by N ?

What is your desired reference frequency ?

==========

Even if you have calculated the loop filter correctly, there are many other ways to have a synthesizer full of undesired spurs....

For example, how well filtered is the DC voltage feeding the VCO ?

Many VCOs will respond quite nicely to any sort of noise on the DC voltage and that'll show up as undesired noise on the VCO output.

Another question is how well buffered is the VCO output to the MC12017 pulse swallowing prescaler ??

Quite a few of the pulse swallowing prescaler chips slightly change their input impedance when going from one divide ratio to another one, and this may easily result in spurs on the VCO output signal.

So, all in all, designing a quiet synthesizer can take some time and careful circuitry. Of course, one of the early things to solve is the loop filter components, and the first three questions will help in doing that calculation.

I do not recall the website ofhand, but there is one that will calculate the loop filter given the proper information.

Maybe one of the main manufacturer's webpages ??

I forget.....

I haven't followed this thread very long, but I'll jump in. Sorry if this
has already been mentioned. Michael is absolutely correct in his response.
How have you constructed this PLL? Is it on a breadboard or PCB? It has
been my experience that it's usually very important that the VCO be well
shielded and decoupled from the rest of the circuitry. Otherwise, the
extraneous signals can cause the VCO to wander and have unwanted jitter.
Perhaps this is what you're experiencing.
If breadboard, then you've got your work cut out; use a separate breadboard
for the VCO and wrap it in aluminum foil to help eliminate external
influences. If on a PCB, the same reasoning, applies, just somewhat
different techniques. The solution will be determined by your physical
layout and the ability of the VCO to be shielded. Again, good decoupling of
the power supply is critical.
Cheers!!!

First stupid question: have you verified that your reference oscillator is
rock-solid stable?

A PLL is only as good as the reference oscillator. If the reference
oscillator is drifting, the PLL will chase it.

Look around the "FAQ" for the sci.electronics.repair newsgroup, which
is at http://www.repairfaq.org I din't know if Sam put in a typical
power supply schematic in the section on switching supplies, but it's
one place to look. When he was writing the repair column for
Electronics Now and then Poptronics, much of the material was from the FAQ,
though I think he sometimes added some graphic material. So likely
when he covered switching supplies in the magazine, there was a schematic
for a typical supply.

And of course, one reason three terminal regulators were invented
was so small sections could have their own regulators.

They are cheap enough that it's hardly worth not having a separate
regulator for the VCO. And maybe even a separate regulator for
the phase detector (and any amplifier) section.

Some other points. Do you have a filter to remove the reference
frequency from the loop. A notch filter will clean out a lot of noise.
I had to straighten out and re-certify the design of a commercial
synthesizer after the purchasing department bought different capacitors
used in the VCO circuit, and in fixing that, I found several other
problems.

Does your power supply use a linear or a switching regulator? To
achieve a very low phase noise we had to use a pair of low dropout
linear regulators inside the shielded case.

How do you bring signals in and out of the synthesizer case?
feed-thru capacitors and coaxial connectors are a must. The Microdyne
synthesizer I mentioned used a DB 25 to connect the power and logic
inputs, and had a two rows of feed-thru capacitors behind the connector
to filter all signals, including DC. Also, make a spare top cover with
small holes to reach test points. Screw it down to the case, and make
any adjustments. Working without a cover can change the frequency, and
in some cases, take the VCO to the edge of its range where you will get
a lot more noise.

A big part of building a clean VCO is electronics, but a lot is
mechanical, too. A solid case, good shielding, and board layout. Mount
the PC board to the case with short spacers, preferably permanently
attached to the case. For homebrew work you can use brass spacers and
solder the them to the case after they are screwed in from the back. It
will make a big difference.

A clean ground system in the RF circuits is critical. We had to
replace a couple cases where a PEM standoff didn't make good contact
after it was pressed in, but moved the three circuit boards to a new

case, and they passed on the first try.

Absolutely. For example, if you need really clean 5V supplies in various places, a good technique is to run a pre-regulated "semi-clean" 12V rail around the system, and then regulate locally to 5V.

Don't rely totally on the IC to clean-up the noise on the input rail. Remember that it's a feedback system, so there is always a high-frequency corner, above which the regulator can't keep up. Above that corner frequency, the regulator becomes increasingly transparent to high-frequency input noise and sharp spikes.

If low output noise is important, include some good old-fashioned R-C filtering between the 12V line and the input to the regulator IC. Don't forget to leave more than the minimum required voltage at the input of the regulator... and that's not the average DC level - it's the voltage at the *bottom* of any noise spikes at the input, so you have to allow a little extra input voltage.

Even so, it's still only R = V/I, like we used to do routinely for zener diodes (I'll swear that half the attraction of IC regulators is that they let people avoid that simple calculation). If you want to use two poles of R-C filtering, simply split the R into two parts.

You're still faced with other sources of noise, for example noise originating in the regulator itself, and things like induced voltages and ground loops... but all those are actually separate problems.

In different applications, R-C input filtering combined with a voltage clamp device is a good way to protect regulator ICs and their downstream components from the very sharp spikes induced by lightning. The pre-filtering reduces the peak amplitude of the incoming spike and also attenuates its high-frequency components, down to levels that the voltage clamp and the regulator IC can safely handle between them.

Source record: 32918

There are the answers to your questions:

>Frequency steps used:
5 KHz

>What is the tuning sensitivity of the VCO in MHz/volt ?
About 4,6 MHz/volt

>What are the values for the divide by N ?
For the test I'm using 271 for the N, and 1 for the A

>What is your desired reference frequency ?
The reference frequency is given by a crystal at 5.12 MHz. So it should be constant. The frequency of the crystal is then divided by 1024 in order to get the 5 KHz reference.

>Actual values for the loop filter:
Cc = 3.9 nF
C1 = 0.1 µF
R1 = 540 Kohms (2 x 270 Kohms)
R2 = 100 Kohms
These values were calculated with the formulas given in the Motorola AN980
(where I picked up the schematic).

>How clean is the power supply?
I don't think it is the problem: I use a battery (not the sector), two separates regulators for the VCO and the PLL board, and there are a lot of filtering and decoupling capacitors.

>How have you constructed this PLL? Is it on a breadboard or PCB?
The PLL is on a veroboard, and the VCO is on a PCB. None of them is shielded.

>How well buffered is the VCO output to the MC12017 pulse swallowing prescaler ??
No problem for this, there's a additional buffering stage at the end of the VCO, in order to feed the prescaler.

>How well filtered is the DC voltage feeding the VCO ?
I don't have any additional filter between the Phase detector filter, and the VCO. Maybe I should add something ??

I've looked closer with the oscilloscope at DC voltage fed into the VCO, and
I've seen that it is varying a bit at a constant frequency of ± 400 KHz, and
also varying (more) randomly at a few tens of hertz. It is a bit strange,
but I hope you can help me :-)
For Jim Pennell: it would be nice if you could remember the adress of the

For the passed few week I have been thinking (and looking into) computer power supply conversions into nice power supplies for my rigs.

Up to now there are two major way to do it (at least that's what I have found)

A) The first way is to put a load on the 5v so it can regulate the 12V tap, but as I can understand this does not utilize Max output

B) The second way is to strip all the unnecessary components (useless taps, -5v -12v est.) and leave the 12v for maximum out put

Any comment would be appreciated and personal experience on this matter.

I have a few atx supplies in the shack and would like to utilize them.

These are the sites I have found.

<< I would like to put together a very simple QRP CW transceiver. The schematic I am using includes a 3.560MHz crystal oscillator.

Maplin's, Farnell etc. sell 3.579545MHz or 3.686400MHZ crystal oscillators respectively and I am wodering will these do the job or should I be looking for a 3.560MHz crstal? The circuit does have a 65pF trimmer capacitor for tuning but I want to sure about the crystal before I order. >>

Chris-

I suggest you get a collection of crystals. I don't think you want a custom oscillator module unless it offers the option of changing crystals.

You should be able to find an inexpensive 3.579545 MHz "colorburst" crystal at Radio Shack. Your 65 pF capacitor may not quite pull it down to 3.560, but it might. Try it and see how it works.

Are there any upcoming hamfests in your area? There was one this weekend Shelby, NC. In a couple more there is one in Melbourne, FL. These are usually good sources for miscellaneous crystals.

Message-ID: <3f5233ff$0$8542$ba620e4c@reader0.news.skynet.be>
Source record: 32925

We have a little problem in our neighborhood.

Recently some *vulgar* people moved in a couple of houses away from mines.
There 2 family's of them in 2 different houses.

Every evening and night the whole street get to hear some very loud music.
It's hard to get some sleep over here !

We went several times to them to talk, and ask to put the volume down, but
they
don't wanna listen to us. (with us I mean me and the rest of the
neighborhood ...)
As a matter of fact they only turned it louder...

Calling the police won't help much too, the only thing they said is "go to
ask if they wanna
set there volume down" when I say we already done this they say "go ask
again"

It's really frustrating, and it's driving me bananas !!!

So now I'm looking for some good circuit to disturb there hi-fi equipment!

Maybe somewhere in the low HF (eg 3.5Mhz) so I can "push" the diodes in the
power
supply in conduction, so he won't hear anything and shut his device off.
This will of course only work if he hasn't got a filter installed.

I also saw some thinges about transmitting static to disturb there devices.

Anyone who got's hint's and tip's for helping me to teach them a lesson are
greatly
appreciated.
I know this is maybe not the right way to do this but with some people you
don't have any other choise ...

Source record: 32926

Hi everybody! (This is the place where you would say hi Dr.nick, but you don't)

I have two oscillators operating at the same frequency that I have salvaged from an really old computer =). I am trying to build a transmitter and a reciever around theese two oscillators. The transmitter should, as far as I have understood, be fairly simple to construct using one of the oscillators, but the reciever is giving me headaches =)

What I want is a simple reciever, not necessary audio, I only want to get a current flowing when there is a signal. Would it be possible to construct a simple one with the other oscillator?

I am fairly new to this sort of electronics and I would like easy explanations or some url's that might interest me :)

I have many capacitators and resistors and transistors. I also have a few coils with ferrite rods inside salvaged from old radio sets. The oscillators are at 1.8Mhz each I think. (I have a few others that match too, but I can't find them anywhere and if theese will work, then I won't bother looking), I might try to use an old AM reciever and try to tune it to 1800khz, but I would like to build it myself...

I have tried to search the newsgroup, but I had difficulities finding anything that really helped so please don't flame that much.

Mvh Torbj&#65533;rn, please excuse my English. You might understand that I'm not a native speaker =)

B): If you remove the 5 volt supply, it will not regulate. If you
"strip all the unnecessary components (useless taps, -5v -12v est.) and
leave the 12v for maximum output, the 12 volt winding will still limit
the available current. You have to re-design the whole regulator
circuit, rewind the transformer, and add more filtering to the 12 Volt
output.

You'd be better off buying a commercial unit that is actually KNOWN to work.
The Valentine One was the best, last I heard.

1562. OCXO Sources?

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-08-31 20:32:28 UTC
From: "Leland C. Scott" <no-spam@junk-mail.net>
Message-ID: <R6udnXGbm9wVxs-iU-KYgw@comcast.com>
Source record: 32929

Several good Ham swaps are coming up in my area and I would like to know what kind of used equipment I should be looking for to get my hands on good quality OXCO's units. Some high quality TCXO would do as well. I would love to get my hands on one of the HP units, particularly the HP-10811. I would like to find one OXCO at a standard frequency of like 10 MHz, 4 MHz, or 1 MHz.

I understand that HP has used three different OCXOs, E1938A, HP-10811, and the HP-10544. I haven't found any info on the first one.

So far the only thing I've found is a TXCO by "HY-Q" marked as "TCO-746", "20.117188" MHz I assume, that I recovered out of a old sat' down converter. From the web site it appears to be in the "D1" case style under customer oscillators with a frequency trim screw adjustment in one corner.

I also have two functional crystal oscillators in a PLL frequency multiplying design recovered from another sat' RX. One is a fixed 810.000 MHz. The second is switch selected between 710.000 MHz, 720.000 MHz, and 740.000 MHz. Both units need +/- 18 volts to operate. Neither unit is an oven controlled or temperature compensated unit however.

So what kind of used "junk" should I be looking at to maximize my chances of finding what I'm looking for?

Deliberate interference, even in a good cause, is deliberate interference.
It can cost you your license. Not worth it to me.

I solved a situation very similar to yours a few years back, solved it
legally, permanently, and better yet I GOT SATISFACTION.

We had the party next door every night. Sunday through Thursday we could
obtain assistance from local law enforcement if we called after midnight,
and when they could break a car loose. Friday and Saturday nights we were
on our own. I had access to a 250 watt PA amplifier and speakers more than
capable of handling the full power output. I did not get into a war of the
decibels with them. I just decided that 06:30 in the morning was a better
time than most to listen to Sousa Marches followed by Overture 1812. They
were quick to complain about not being able to sleep. It only took two
mornings before they decided that if they wanted to sleep in the morning
they should allow us to be able to sleep at night.

Oh did I mention we are a townhouse community, and the sinners were not in
my building. Neither were the speakers, they were positioned in the
neighbors townhouse that adjoined the loud neighbors, positioned on the
party wall that was common to both master bedrooms.

Hi,
We, South Birmingham R.S, are looking for a 50W or there abouts 10Ghz
TWT and Power supply. Anybody got anything they would like to part with :)?
We also have a 15W 6Cm's SSPA for sale, simple 12V in jobby, no -V Biasing
required :). Comes on a VERY big heatsink.

I now have time to build but it seems that no one is selling small parts
except with large minimum orders or low variety of stock. Right now looking
for ADC converter chips but next week might be something entirely different.
Who sells small quanties of small items?

A lot of chip makers now sell in small quantities on their website,
and a few will "sample" a chip or two for free. It helps to know what
you are looking for, if you want to know where to go. ;-)

haven't found any info on the first one. >>

Leland-

My HP counter has a variation of the 10811 oscillator. To calibrate it, I bought a 10 MHz rubidium-controlled oscillator on E-Bay, and it is impressive how little drift the 10811 has over a long period of time. I use an oscilloscope to compare the two 10 MHz signals, and can count the number of seconds required for the sine wave to drift one division, where ten divisions equal one cycle.

I also bought the counter on E-Bay. The seller insisted it had been checked out and worked fine. What I found was that the 10 MHz oscillator could not be adjusted onto frequency, and it never quite stopped drifting. After an investigation that included purchasing a 10811A/B manual, I found that the 10811 had an open thermal fuse. Further, the HP/Agilent parts department was not able to determine the correct replacement part until I had the manual in hand, and could tell them the original part number!

It seems that the 10811 (and possibly the 10544) oscillator series was originally designed with too low a temperature rating on the thermal fuse. At some point a new higher value was chosen. If you happen to encounter the problem, there is a good chance that if it doesn't have a burned smell, all it needs is the new part. Mine has been working flawlessly for over a year now with the newer thermal fuse.

I assume if the thermal fuse is shot the
oscillator won't draw any oven current? I did find
a page that shows how to disassemble the 10811. It
doesn't look all that inviting. Seems the author
of that page had most of his problems dealing with
the sticky tape they use internally. He had by the
way also reported a drifting problem. That's why
he took it apart. But he did say he couldn't find
anything wrong with the unit either.

Thanks for the heads up about a known problem with
the 10811.

Source record: 32940

Hi Harke,

you are right with your assumption that the XRF is a pre-production sample.
After full qualification at the Motorola factory the transistores are named
MRF.

The MRF18085A is a 1800MHz final transistor for DCS-Basestation power
stages.
That means that Motorola is testing the parameters of this parts after
production
at this and only at this frequency (linearity, output power, compression,
...).

It should be no problem to use this parts at lower frequencies, it's still a
normal ldmos-trans.
What you can expect is more gain and a higher output resistance.
I had designed a 2m low power stage (3W) with the MRF281 which is built for
900MHz and higher
and it worked well.
The only problem could be to get the S-parameters for your frequencies, but
if you have
a good test equipment you should can do this job.

Well, there are a lot of things you _COULD_ do, but most of them are illegal and/or immoral. If you are a licensed Ham, there are even more things you could probably do, some of which would definitely disrupt their little parties, but again they wouldn't do your self or license much good.

If you don't have a reasonable response from your local law enforcement, you may have to get a bit creative. Before you do, however, make sure that every time there is loud and/or vulgar noise after 10:00 pm, call the police. Get everyone else in your area together and have them call too. Soon, they (the local police) won't be able to ignore the complaints, and will have to respond to take care of the problem. After enough calls and enough responses from the local constabulary, most reasonable people will tone it down....

Of course, there are some people that "can't take a hint" and you may need to take other steps... like perhaps dropping by the local "biker bar" and putting a little business card on every bike outside, giving the address of the objectionable neighbor and offering free beer to all "biker brothers" that come by... You'd be surprised how this will curb parties for some people. If the offending neighbor has a real business card, perhaps one could "accidentally" knock over a bike at the local biker bar, leaving his business card with a scribbled apology with the offer to pay for damages and giving his home address to come by for the money.... When the biker and his "buds" arrive, the bad neighbor may not get the point, but he will surely be distracted enough he may not want to have any more noisy parties....

There are numerous other things you can do, but the biggest thing is to distance yourself from the actions so you aren't tagged as the cause of his new problems...

If all else fails, perhaps reading a series of books penned by someone using "hayduke" as his pseudonym, titled Getting Even and More Getting Even" (or something to that effect) will give you some ideas. Beware that many of the things Hayduke suggests are illegal and could get you in more trouble than you'd imagine, but it may give you a fresh approach to dealing with your problem.....

There are gross, direct ways to take care of a problem, and subtle ways. Which you choose is up to you, and the risk you are willing to take to rid yourself of this thorn in your side. For myself, I prefer subtlety and letting the universe take care of things.... Of course, I've been successful with subtlety in the past, so of course, I'd think ti would be the best way, but you have to determine which is best for you...

Good Luck!

My main source for parts is DigiKey (http://www.digikey.com). They are not the cheapest in the world, but they are quick, and they have the largest selection, and their customer service is second to none. They do have a $25 minimum order and you need to be careful to specify UPS Ground or you will end up paying expensive shipping.

Their selection of RF parts is a little limited, however. If you have time, and he has what you happen to need, Dan's Small Parts and Kits (http://www.danssmallpartsandkits.net/) has a lot of what you need for amateur radio related construction, and he typically has prices that are lower than anywhere. But he only deals by snail mail, which means at least two weeks round trip.

http://www.kitsandparts.com (W8DIZ) has the best prices anywhere for toroids, and he also stocks a limited supply of oddball parts at very good prices. His stuff is small so he can generally ship by Priority Mail (which generally translates into cheap).

http://www.bgmicro.com has a changing supply of parts, but for some things they can be very cheap, in particular, LCD displays and connectors, if they happen to have what you want. Be aware, however, that much of their stuff is used or pulls, so be sure you read the description carefully. Also, for some things, they are quite expensive. But there are items where they are the best choice. I also put Mendelsohn's (http://www.meci.com/) in about the same category. They have more stuff but it tends more toward the mechanical.

Finally, if you need an RF power transistor or a large variable cap, http://www.rfparts.com seems to be the only game in town. They are expensive, though, and they have a $25 minimum order. However, unlike DigiKey, it's tough to find $25 worth of stuff you want to buy there, partly because if anyone else has something they have, it will be cheaper elsewhere.

So a big part of the answer is shopping around and planning. Unless you buy to stock your parts drawers, you can easily spend more on shipping than parts for any given project. You need to work out the total package. You could easily save 6 or 7 dollars getting an LCD display from BG instead of DigiKey, but the shipping is going to cost you $9, so unless you are buying a something else, it might not be worth it.

As usual, no connection to any of these perps except that they are key contributors to lightening my wallet! Oh, yeah, and I've met W8DIZ a bunch of times, he's a cool guy, chief perp of the Flying Pigs and a member of ARCI.

1577. RF amps: tuned load in Class A?

Newsgroup: rec.radio.amateur.homebrew

Is a tuned load (tank circuit) a viable load for an RF amplifier
operating in class A? Or is this type of load only really suitable for
class C?

Of course you can use a tuned load with class A. But the nice thing
about a tuned load is that you don't *have* to use class A to achieve
a clean output. Of course, if you are using an amplitude modulated
signal, then you will need class A.

In addition to proper loop filter parameters, separate supply regulation,
etc., a VCO needs to be placed and usually shielded to keep outside
noise from perturbing the control voltage ... you could be getting stray
pickup of RF, digital noise, etc. onto the control voltage ...

That is, if the input signal is already AM, you need a class A or linear amplifier. If the AM is to be done at that stage itself, then its the class c non-linear bit that makes the multiplication modulation work.

Yes but the VCO, if I control it manually (with a potmeter instead of the PLL), it is quite stable (enough for me ;-). So the main problem I have now would not be solved with a shield, I think.

True - I was considering only the "carrying the signal" case. Anode
modulation of a PA is a different matter.

<< > My HP counter has a variation of the 10811 oscillator. To calibrate it, I
> bought a 10 MHz rubidium-controlled oscillator on E-Bay,

What did that cost you? Also how long are the lamps good for anyway? I imagine they are expensive to replace. >>

Leland-

I paid $225 plus shipping for the used rubidium-controlled oscillator. I had to build a 24 volt DC power supply for it. I have read various articles about lamp life. It seems that E-Bay sellers will claim that they were designed for several years of continuous use. The trouble is that you don't know how many years a second hand unit has already been used! They are most likely being sold after having been replaced as preventive maintenance. I only run mine when I need it for calibrating an oscillator. I would expect it to be cheaper to buy another used rubidium oscillator than to repair the one I have. If it does go bad, I will look into one of the HP GPS-synchronized oscillators that are available on E-Bay.

<< I assume if the thermal fuse is shot the oscillator won't draw any oven current? I did find a page that shows how to disassemble the 10811. It doesn't look all that inviting. Seems the author of that page had most of his problems dealing with the sticky tape they use internally. He had by the way also reported a drifting problem. That's why he took it apart. But he did say he couldn't find anything wrong with the unit either. >>

The oven won't draw current but the oscillator will. An Ohm meter check between the oven power lead and ground should be relatively low, maybe a few hundred Ohms?

You DO NOT want to disassemble the oven! All you need to do is remove the end plate. As I recall, there is a flexible cable near the card-edge connector, that hides the thermal fuse. The original thermal fuse looked like a tiny electrolytic capacitor, and plugged into tiny pin-sockets on a circuit board. The new version looks more like a ceramic quarter or half watt resistor.

If you are interested, I wrote up my experience and E-Mailed it to ARRL's Hints and Kinks. It was published on Page 68 of the November, 2002, issue of QST.

Please do not take this as a condemnation of the 10811 oscillator. I am very impressed with how stable it has been over a long period of time.

Okay thank you. I don't know well what values you want; I took what was advised in the motorola application note
loop damping factor = 0,707
VCO gain = 25 132 741 rad/V
VCO center frequency = 77 MHz
PLL supply voltage = 5V
etc.

The values of the components of the filter are given in a previous post.

Hello,

I wouldn't waste your money, by the time your detector has gone off it's too late anyway if you're speeding.
I bought a radar detector as a toy to play about with. It detects traffic lights, shop doorways and the odd speed camera. It also has a laser detector built in which DOES NOT work. I tested this with a police man on the A41, he was happy to show me the unit was a load of junk. I was amazed that it didn't trigger when the police man was standing there with a laser trap on a tripod!
Mine is a SNOOPER as sold in car shops etc. It is a waste of time from what i have experienced - it's just a toy.
It does sometimes detect the microwave stuff if I drive past a PMR site which is interesting.

Sorry, can't help you with a diagram, the detectors are overpriced toys.

Watch it - many of their kits (at least when I last built one a
few years ago) were marginal designs, sometimes illegal, and
used components of questionable quality. Two transmitters -
one enabled the PA before the PLL locked, so it swept noise
across the band, and one was a multiplier design with *no*
filtering so it splattered every 12 MHz up and down from 2M,
an amp with a long thin ground trace for the final, etc.

/mike

I like my method better. The twist-in cap usually will hold the fuse
well enough that one doesn't have to be touching any metal when the
fuse is pushed into the holder and screwed in. He who doesn't touch a
conductor doesn't become one.

Hi,

Passed an earlier post about ITEA and ARRL on to the ARRL and here is the reply I rec'd
from Mark at arrl. He has some good infomation

73 james

Lots of fragmented e-mails attached before it made it
to me, so I hope I can
address the essence of your questions. Perhaps you
can pass the information
along to the initial query.

The ARRL participates in the ITEA annual conference
with a booth that displays
the virtues of ham radio in the classroom and the
ARISS program. ITEA as well
as the national science and math teacher's
associations operate on tight budgets
and therefore it is expensive to participate in their
programs an to gain
exposure through their programs. If it were not for
the generosity of NASA, who
pays for the booths and invite us to participate with
them, the league could not
afford to gain access to these organizations. They
are aware of the Project and
the ARRL, but as of yet, I have not seen them actively
push schools to consider
participation. Hopefully over time, that will change.

As far as kits are concerned, there are lots of them
available. It really
depends on the goals of the teacher, how the kits are
to fit into their
curriculum, and what is the ability level of the
students (as well the
teacher's/school's sensitivity to sticker shock).
Local ham clubs could be a
source of funding and help. Some of the kits are
elaborate and expensive,
others are inexpensive. An Internet search for
electronic kits will produce a
mound of hits that the teacher can explore. FAR
Circuits and RAMSEYS are a

couple of commercial outfits that provide a variety of kits. Crystal radios are inexpensive and simple, can be made for a few dollars above the cost of a set of high impedance earphones, but they require careful construction and observation to gain any real value out of them. In the Project curriculum, I have a few circuits that demonstrate electronic principles. These circuits use common Radio Shack parts and should be an inexpensive learning tool. Jameco offers some education kits that might be interesting. Parallax offers a robotics curriculum with lots of hands-on activities, but they tend to be as expensive as they are powerful.

One final suggestion in working with 6th graders. When I taught electronics to that level I found a project that really peeked their interest: a remote, wireless transmitter. This little project broadcast a signal over a standard FM receiver. The teaching possibilities are numerous, and the direction the teacher takes with this concept can go all over the place. The kids really loved it....but there were a few parents that wanted my neck. The criticism of some parents was that I was teaching their kids to spy and listen-in where they shouldn't (i.e. parents and sister's bed rooms). (part of this problem came from my background before going into teaching). The thing is, that even though there is a potential problem in this regard, this issue raised a whole new area of instruction...ethics of electronics... that I turned into additional lessons.

Hope I hit on some of your questions.

Exactly the same thing happened to me. It's fortunate I found a service manual for my frequency counter on eBay or I might never have diagnosed the problem. The manual states that the normal operating temperature for the oscillator is 80-84C. I bought new thermal fuses from Digi-Key. Investigating the properties of these devices I found that the exact temperature at which they open isn't a simple thing to determine. To be safe but avoid the fuse opening again under normal conditions, I selected a Panasonic "N124" type rated at 130C. The Digi-Key catalog number is P10922-ND. This turned out to be a bit larger than the original part. I suggest you try the smaller "F130" part, catalog number P10913-ND. Just to be safe, of course, verify these part numbers before ordering.

Taking apart the oscillator is a bit nerve-wracking if you don't know what to expect, but the fuse replacement isn't at all hard to do.

Have fun.

<< Exactly the same thing happened to me. It's fortunate I found a service manual for my frequency counter on eBay or I might never have diagnosed the problem. The manual states that the normal operating temperature for the oscillator is 80-84C. >>

Henry-

I had the service manual for my counter, but it did not have sufficient information about the 10811-series OCXO, for the HP/Agilent parts department to identify the thermal fuse. I had to obtain a separate manual for slightly different oscillators in that series.

The temperature of the oven is chosen to match each specific crystal. The thermal fuse should be sufficiently high that it won't open in normal operation, but will if there is a problem. The original part for my oscillator was rated at 108 degrees C. The revised part is rated at 115 degrees C. It is HP/Agilent part number 10811-80008. Last year the price was $10.50 plus tax.

I also found a 117 Degree C "Thermal Cut-Off", NTE Electronics NTE8115. Radio Shack has a #270-1322A thermal fuse rated at 128 degrees C. Both of these are larger than the original part, and their leads are too fat to fit in the original pin sockets. I solved that by finding a high value resistor with the correct lead diameter, and soldering it in parallel with the thermal fuse. It was necessary to use a heavy pair of pliers as a heat sink to avoid melting the fuse element while soldering! The larger thermal fuse with its parallel resistor is a tight fit. I used some fiberglass tape to insulate it, to keep from shorting to nearby components.

I eventually replaced the substitute with the correct part, and it has been working for about a year now with less than a tenth of one Hertz drift at 10 MHz, or better than ten parts per billion compared to the Rubidium controlled oscillator.

Hi Deos,

I am using a modified PC power supply for my transceiver and it works like a charm. What I had to do is as follows:

1) Remove the "missing voltage" protections that monitors +5, -5 and -12
2) Remove the 5V rectifier.
3) Remove the 5V voltage control loop.
4) Close the voltage control loop on the +12V only and recalculate the ratio in order to obtain 13.5V
5) Replaced the 12V rectifier with a higher amp capability. Do not use the 5V rectifier. I used a 100V 20Amp Schottky.

Let me know if you want more info.

Hejsan Torbj&#65533;rn,
You are indeed quite correct in that the transmitter is easy. 50 turns on a
ferrite rod with a 250pf tuning cap and a low impedance coil (say, 10 turns)
from the oscillator module. Tune for maximum "smoke".

A simple diode ring mixer or in fact any old mixer will take an antenna and
oscillator to make a receiver. (such as
http://w1.859.telia.com/~u85920178/rx/quickrx.htm).

You do have a problem. If the TX and RX are on exactly the same frequency
then the difference frequency is zero. So you will be receiving 0Hz
modulation from the TX. If you had a 800Hz frequency difference then you
would hear or be able to detect something. You need two oscillators of
different frequencies.

Finally, to operate at 1.8MHz may not be very nice for other users. Even a
few mW from a ferrite rod can give surprisingly large distances. I certainly
will not hear you in Stockholm, but you could have a few nasty surprises.
For example, many of the older chordless telephones used this sort of
frequency, but I think it may perhaps a little lower. Depending upon the
selectivity of these phones, you may quickly find yourself detected.

Another point is that it is a bit unsuitable to do tests in a radio amateur
band. Amateurs are proud of their licenses and even if they heard someone
"just playing" with low powers in their bands, then you would find yourself
reported. There are other bands you could experiment with where the users
are not so many or object to "intruders".

A suitable band would be light. An infra-red diode can have a standing DC
current fed into it, then you can couple your oscillator in there to
modulate the light. Any IR-LED receiver will receive that frequency, in fact
you can have your own legal HF band, right there in your home without fear
of annoying anyone. You can even connect IR-LEDs to the antenna socket of
communications receivers and get up to 50 - 100 metres range (line of
sight).

> I need a pinout for the microphone connector on my KDK FM-2033.

There is always a simple way to identify MIC connections, no-matter what rig you have.

Power-OFF - use Ohm-meter to identify the Gnd terminal pin (chassis)

(now power on):

Touch 470-Ohm between each pin and Gnd - identify the PTT pin.

Ground PTT, touch other pins with finger, listen to mod to identify MIC input pin.

RX, squelch open, touch high-impedance headphones (in series with 0.1uf cap) between Gnd and other pins in turn. Identify if there is a RX out.

+12v via 47K to any remaining pins, one at a time - see what happens.

Hi,I am student & curiously want to build a practical ,high frequency
spectrum analyzer ,
Do you have any comment about " matjaz vidmar,s53mv" articles on VHF
COMMUNICATION magazine ?
Has any one worked on it?
I've heard there are some problem on the " microwave vco" , which is
one of the those articles ?is it practical? Is it simple to build?
What is the epsilon (r) of glassfiber epoxyFR4 ?
Any comment?
Any help would be most appreciated.

My limited experience with a group of exit lights is that they used
special expensive bulbs, but the electric supply place I went to find
replacements suggested some relatively new (at the time) replacements
which had a significantly long life spec. They were (are) neon bulbs as
I remember, and they have lasted many years. Well worth the money.
Exit fixtures have specs on what bulbs are to be used, I think.
Also, as someone stated wrongly about neon bulbs requiring high
voltage, they instead need series R to limit the current. --Phil

Woohoo ! I finally found, I had used 92 ohms resistors instead of 92 Kohms resistors... how inattentive I am sometimes ;-) But it isn't yet perfect, I've took a picture of the oscilloscope, showing the output signal that is fed into the VCO (http://www.mcarsweb.com/_divers/oscillo.jpg the vertical scale is enlarged). It is slightly varying, at a frequency of about 187 KHz. I don't know if I should change the filter values, or add a additional small filter, with a resistor and a capacitor between the output and the ground. What do you think about that ?

Damien

Chris

I-Q Electronic Design had 3.560 MHz xtals in their advert in the summer edition of SPRAT the G-QRP club magazine - e-mail vincent@jakomin.fsnet.co.uk. There are also low power miniature 3.560 xtals and 3.68 MHz ceramic resonantors in the member sales for the G-QRP club. www.gqrp.com/ Some sale items are members only but at £6 pa membership is a bargain and you will get SPRAT magazine which covers just the kind of simple low power rigs that you are interested in.

Best regards

Mike G3TGD

<< Now with the above facts in mind, which do you think is safer? >>

Ehsjr-

You are rationalizing. The need for the light is greatest in the event of a fire. With two bulbs in series, the resulting light is weaker and harder to see in dense smoke.

Most of the time you won't have a fire. You could carry your rationalization further by eliminating the lights and having zero chance of accidental electrocution or falling from the ladder, and save on the electric bill to boot.

Good Luck.

Fred

1619. Why different rectifier diode voltage ratings?

Newsgroup: rec.radio.amateur.homebrew

Another question resulting from too much time on my hands. Why do we have rectifier diodes (e.g. 1N4xxx, 1N54xx) with different voltage ratings? Other than the voltage rating I don't see any differences on the data sheets I've looked at. Why not just make and use 1kv diodes alone?

73,
Mike, KK6GM

Lower voltage rectifiers are easier to make and therefore cheaper. Further, they have lower forward drop and are faster. No point in using too high a rating if these other factors are worth considering.

>the low votalge one.......(some stores some cases)

You might be surprised.

In fact, cost reduction is a *big* issue in the manufacture of many
(most?) consumer electronic products.

Look at it this way: if you save three cents on a single part, of
which only one is used in a $100 device... and you manufacture a
million of these devices per year... then you've saved $30,000 per
year. That's not chump-change.

If you can save $.03 per part, and you use ten of these parts per
device, and you manufacture a million units per year - then you've
just saved $300,000, which will cover the cost (salary and overhead)
of at least one good engineer.

Yes, my friend, big electronics companies _do_ care - a lot - about
shaving the pennies out of the bill-of-materials cost of the devices
they manufacture.

tax.

Thanks for the info, Fred. Since the oven temperature is controlled by a thermistor circuit, the selection of the thermal fuse should have no effect on the normal operating temperature or oscillator stability (unless, of course, the fuse opens). Digi-Key's price for these devices is 45 cents each, a considerable cost savings.

The NTE part is definitely too big, but the smaller Panasonic F-series should fit perfectly.

I wanted to understand why the original thermal fuse opened if its rating was 105C. It turns out that the behavior of these devices depends both on the temperature, the rate of change of temperature, and the amount of current flowing through it. The spec sheets list three or four cutoff values for each device, depending on the test conditions, spanning a very wide range (30C or more!). The 130C unit I selected has a long-term maximum temperature rating of only 80C at 5A DC current. I figured this was a reasonable compromise given the nominal 82C operating temperature of the oven.

The thermal cutoff point will also change due to soldering heat. All in all, these are pretty complicated devices...

Yep. And I'd wager if one did breakdown tests on a variety of diodes many would show the same specs regardless of their different markings.

Another pet peeve-
Several times I've seen failure of low voltage capacitors which were run too close to their ratings for comfort, IMO. Like 16 vdc rated on a 13.8 DC line in mobile gear. Spikes are sure to take 'em out eventually, it would seem. Why designers do that I've never understood, and I never replace them as rated, but use 25 or 30 volt caps. Never had a problem from doing that, and no repeats.
I remember years ago troubleshooting a dead board in an Atlas 210 transciever that had a shorted - leaky 16 volt rated electrolytic across a 13.8 dc line on the board. But it still had enough internal resistance that it didn't smoke anything, just killed the operation of the board.

I cussed the (unknown) designer of that thing for awhile! /:-D))

You have to consider the age of the unit, and the fact that the
higher voltage capacitors were larger, and sometimes there was no room
for a bigger part. Today's electrolytics are generally smaller, but you

want to watch the rated operating temperature, and the ESR of new
capacitors.

1629. Re: Why different rectifier diode voltage ratings?

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-04 02:42:32 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <vld9l3ck30qh5e@corp.supernews.com>
Source record: 32996

There's something else important to know about electrolytic capacitors. After a long time, they *become* good only to just above the applied voltage, regardless of their ratings. The reason is that the insulating layer is formed by electrolysis, which requires current flow. The initial layer is grown at the factory, but it very slowly dissolves in the electrolyte. If, after a long period of time it gets too thin, a small leakage current flows, which re-grows the coating -- but only until it's thick enough that the current quits flowing. That's what you're doing when you "re-form" old electrolytic capacitors -- you apply a voltage until the coating gets thick enough for that voltage, then you increase it a little, causing leakage current to flow until it's thick enough for the new voltage, and so forth. But if it runs at a single fixed voltage for a very long time, that's all the thicker the coating gets -- just thick enough to sustain that voltage.

Aside from this, good design practice calls for using electrolytic capacitors at no more than half their rated voltage. But corners are sometimes cut, for either cost or size, or just due to a naive trust in the rating and ignorance of the effect of aging.

And boy, howdy, can you have some incredible voltage spikes -- with lots of energy -- in a vehicle system.

Roy Lewallen, W7EL

Battery matching.

Here is how I would go about it. Charge the cells individually untill their voltage starts to drop, aka. peak charge them. Measure the peak voltage. Then hook them to a fixed load and measure their discharge time to 0.9V. Let the cell rest. The next day repeat. Take the measurements and compare close discharge times and close peak voltages. If you could measure internal resistance it would be nice, but I don't know of a simple way. In my opinion the important qualities are.
1. Close discharge times
2. Close and low internal resistances
3. Close peak voltages

That's what receivers would use since power consumption doesn't matter much. It would be true for low level TX'er stages too, again because of power consumption. But for things like "Ham linears" it is not necessarily true.

> That is, if the input signal is already AM, you need a class A or linear
> amplifier.

Let's be specific regarding the your word "linear" since "or" implies something else other than class-A may be possible. Single-ended "linear" narrow band amps may be biased class-B if the tank has a high enough Q. The missing half cycle is restored by the so-called "flywheel effect." In practice deep AB is also used.

> If the AM is to be done at that stage itself, then its the
> class c non-linear bit that makes the multiplication modulation work.

No. It can be done with class-A or class-B since the assumption is that the amp will be driven (or nearly so) to the rails by the carrier alone. The reason class-C was used was for efficiency. Nowadays, AM broadcast stations use class-D with some regularity.

While the 1 kV 1N4007 is definitely a different creature (with some
PIN diode characteristics) compared to the lower voltage 1N4001-1N4006
rectifiers, I very much doubt that they make separate wafers for
1N4001, 1N4002 etc. but instead try to make, say a 500 V rectifier.

My guess is that they just measure the reverse leakage voltage at
various voltages and print a different label, based on these
measurements. Those passing only the 50 V test will be labelled 1N4001
and sold at a slightly lower price and so on.

If there is a huge order for 1N4001 and there is not enough 50 V units
produced, some units tested OK for 100-500 V are labelled 1N4001 to
full fill the large order. Thus, some selected 1N4001 parts may work
even above 100 V.

If you go to http://engphys.mcmaster.ca/~elmer101/ you can get a detailed, blow-by-blow of each circuit. Unfortunately, he linked to schematics at Chuck Adams' page, which are now gone. The QRP-L CD contains the same web page description of all the SW circuits, and in addition, all the discussion of the builders during the Elmer 101 project which was based on the SW-40+. You can get the QRP-L CD from the ARCI Toy Store.

There is also a similar description on http://home.earthlink.net/~hamkitbuilder/elmer101.html

The manual, translated to German, is available online at http://www.qrpproject.biz/manuals/SW40+Manualdeutsch.pdf. The schematic, however, is in English.

There is a bunch of more stuff at various qsl.net sites, which likely include the schematic. However, qsl.net seems to be down at the moment so I can't look.

I also found a schematic laying around on my hard drive. It may be a tad stale but I'll email it to you.

The internal resistance of the battery changes as the battery is discharged.
Also things like temperature, age and other factors effect it.
I think the proper way to test your battery is to fully charge it to the
manufacturer specification and discharge it at a given amp hour rate.
Compare your discharge curve with the manufacturer. Choose the same
discharge rate that the manufacturer does btw. If your curve is a little
less than what the manufacturer says then your probably ok. If it is much
less then you need a new battery.

Hi,
I am new to ham radio. Well I found lots of QRP receiver circuit on web, I tried to build some. Everything going to be OK, except making coil inductors. I don't know how to calculate them, with type I need (air core or slug tuned), what a difference between coil and RF choke. Let's assume I need a 100uH coil. How to star making it. I looked for factory made coil at my radio shack store, but I only found bobbin for coil.

If you know any interesting link on this topic, please let me know. I'll appreciate any comment or help.

Thanks in advice,
Edgar

No. Its Yes. Non-linear action generates the multiplication products. I
was not drawing any real distinction between class c and b in this
context. The practical difference is minimal. They both do not amplifier

the waveform in a linear manner. I was not meaning to infer that it was an "only" c. I was referring to the fact that you need at least some method that generates non linarity.

>It can be done with class-A or class-B since the assumption is
> that the amp will be driven (or nearly so) to the rails by the carrier
> alone.

I agree, this is another method of generating x-product multiplication terms. However, arguable, a class A amplifier is not really a class A amplifier if it is driven to saturation. Its a really a switching amp or, a pulse amplitude modulator if its rails are varying.

Thanks, Roy. I never before heard "reforming" described that completely , and that does help
explain a few things seen in older gear. Sometimes old electrolytics come right up and act like
they were last turned on yesterday. Sometimes not!

This one goes to the 'saved' file.

Source record: 32859

Although the bandwidth of a phase modulated signal is theoretically infinite, the vast majority of the energy is in a finite bandwidth. So if you filter signal components beyond that bandwidth, you can still recover the modulation information adequately. What you have to do, then, is to design the tank circuit so its response isn't too narrow to pass the modulation information. If it is too narrow, it will decrease and distort the modulating phase shift.

If you were to build a tank circuit that acted as a perfect "flywheel", i.e., had zero bandwidth, you wouldn't even be able to pass a code or voice waveform through it -- everything would come out as a single frequency, single amplitude sine wave, or nothing at all. (It would also take an infinite time for it to respond to a signal.) For amplifying some very broadband types of signals, tank and other tuned circuits are avoided altogether.

1643. Re: Making inductors

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-04 19:06:58 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <vlf3al9la7okba@corp.supernews.com>
Source record: 32860

Inductors have several different and important properties besides inductance -- loss (Q), stray capacitance, and temperature sensativity among them. If the coil is wound on a magnetic core and DC is passed through it, core saturation can be an important consideration. Which properties are important depends on the application. So you'll very often get badly reduced performance, or a non-working circuit, if you substitute one type of inductor for another without knowing much about them. Consequently, a decently written article should include details about how each inductor is made. If that information isn't provided, I suggest contacting the author of the article to find out what he used. That's just about the only way of insuring that you'll get the same performance the author did.

If you're interested in building QRP receivers, there are a number of sources where you can find good circuits which include the necessary information to build them. The very best, although perhaps a bit expensive for a beginner, is _Experimental Methods in RF Design_, available from the ARRL and other dealers. Less expensive, and a tremendous bargain, is a CD containing the contents of 109 issues of _Sprat_, the magazine of the G-QRP club. For only $25 + $4 shipping ($15 + $4 for G-QRP club members), you get an amazing amount and variety of information. It's available in the U.S. from Kanga US, contact Bill Kelsey at kanga@bright.net. To order from other contries, go to http://www.gqrp.com and click the "Club Sales" link.

1644. Chassis-bashing revisited

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-04 19:07:49 UTC
From: Joe McElvenney <ximac@btinternet.com>
Message-ID: <VA.0000007b.0054fcac@btinternet.com>
Source record: 32861

Hi,

Whatever metal-working skills I acquired during my training as a radar fitter in the Royal Air Force so many year ago have evaporated it would seem (RAF Locking 1958). Just now I tried to cut some short strips from a 3mm aluminium sheet using a hacksaw and made the worst possible mess of it.

No matter how I tried, I couldn't stop the cut veering to the right. In the end I just cut out the pieces larger than required and filed them to shape. The end result was OK but what a waste of material.

So, what is the technique for hacksawing a straight-ish line by hand. I guess that as my cuts always went the same way it was something to do with how I was standing and holding the hacksaw. Any tips would be gratefully received.

All those years ago I passed the necessary trade tests so I must have had it down pat then.

>Any tips would be gratefully received.

Joe,

Of course, what would be nice for this job would be a high power laser, but I don't have one either. Lacking such sophisticated tools, we just do the best we can with what we have. Use a hacksaw blade with a fine pitch, make sure the blade is tight, and cut at a small angle so more of the blade is guided by the part you've already cut. (30 degrees good, 90 degrees bad.)

Some kinds of large tin snips are easier to control, but tend to curl the material more than a saw blade. A nibbling tool is OK for small pieces, but will quickly wear out your hand.

I've been hacking, punching, snipping and drilling holes in chassis since 1953.

Hope some of that helps.

Doug Moore KB9TMY (Formerly K6HWY)

There aren't any relays these days. Stuff like motors and electromagnets (used to steer the little ones) are run directly from transistors or chip outputs.

The very tiny HO scale cars have only 3 outputs, all fairly low current and limited to about 3V. I'm not sure what's in the larger vehicles today, haven't fooled with one lately. RS used to show the circuit boards for the cars and transmitters as separate hobby items (with instructions) in their catalog, but may no longer do so. Why not check out someone like LINX on the Internet, who make transmitter and receiver modules. Their application notes show many interface examples.

Instead of sawing it, try scoring it on both sides with a Stanley knife,
then bend it backwards and forwards. It will snap along the scoring, quite
quickly.

100 uH is quite a lot of inductance for a radio circuit, expecially at HF. Inductors around 10 uH or less are very easy to make using toroidal cores. For instance, a 5 uH inductor is about 32 turns on a T50-2 core. I use a simple Excel spreadsheet for this sort of thing.

RF chokes are basically inductors, but specifically intended for stopping RF from going somewhere unwanted. They are usually wound on ferrite cores, and tend to have fairly high inductance values. They are used on their own, usually, unlike coils, which tend to be used with capacitors. RF chokes have a self-resonant frequency due to their self-capcitance - this needs to be checked when using them and the self-resonant frequency avoided.

3mm is about .120" ...
reasonably thick stuff..
Al tends to gall so use a suitable blade and make sure tooth spacing is
significantly under 3mm..
Scribe a good line and clamp between two boards or plates..
Also try using oil or water as you cut with the saw at an angle..
Failing that find a place with a shear!
I was in the RCAF in 1959 and as best I can recall everything fit.
Mostly stuff from south of the border.

Sometime in the past year, there had been a similar request on one of
the radio groups, and I and several others had replied with specifics.

In ham radio, that connector is used on several Yaesu HTs, including
the FT-50/10/40, VX-150, VX-5, etc.

It is also used in some newer high-end video components.

I think most QRPers do this. (well, I actually have a spreadsheet like someone else mentioned). Although there are a dizzying array of toroidal forms available, you can cover almost everything you need for HF with just a few mixes. Generally, T50-2 below 10 MHz, T50-6 above for tuned circuits. Some FT50-43's will handle most of your broadband transformer needs. QRPers tend to like small, so they will also stock the 37 size as well, and sometimes even the 23. If you are a real fanatic, you would like to have a couple of T50-7's around for VFOs. The -7 mix has a little better temperature characteristic, but temperature stabilizing a VFO is a major pain no matter how you cut it. If you are the QRO type, you may want a few bigger ones, as well, especially for transformers.

Toroids have a bunch of advantages over helically wound coils, but you will get higher Q with air. The main problem with helical coils is that you need to leave a lot of space between them, and that makes the whole mechanical stability thing a lot harder because things are bigger. But, if size is no object, and your chassis is half inch thick steel, then air wound coils with huge wire will work better.

As always, all the equations are in the handbook. Paul Harden's "Data Book for Homebrewers and QRPers" has all the tables, without the explanations, and it's a lot more compact (and cheaper besides).

True enough. But there's a sense running through this thread that
inductors are inherently imperfect whereas capacitors are perfect. It
seems appropriate at this point to put the record straight and say
that caps, like inductors, have their paracitic characteristics and
widely varying internal losses between different types of the same
value. Like a coil, a capacitor will also self-resonate and this
problem will generally be more noticeable if its leads are not cut
very short. At RF, both coils and caps display behaviour which is
totally unlike that when they are operated at DC or audio frequencies.
Caps really are no better than coils in this respect and of course,
the higher one goes up in frequency, the worse these problems become.

I usually clamp a thick, "sacrificial" straight-edge along the line
to be cut. Use another "straight edge" on the back side -- but a wee
bit back from the scribed line. Clamp at as many points as practical.
Cut on the "outside" edge -- of course. Go slow , and , as another
poster mentioned: Cut at a 45-30 degree angle. "90 degrees == bad."

It does. Small phase changes are not affected as much as a large
changes. For small changes (such as used for ham radio) the effect
is not noticeable.

1656. Measuring small inductances using a return loss bridge

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-04 23:34:42 UTC
From: Richard Hosking <richardh@iinet.net.au>
Message-ID: <3f57cc32$0$23610$5a62ac22@freenews.iinet.net.au>
Source record: 32872

My Friend Rod VK6KRG uses a snazzy method of calculating inductance using a return loss bridge
I have tried it to measure a 500nH inductance and the result agrees closely with the calculated result for an inductor of that physical size and number of turns.

Basically he uses the unknown inductor, in series with a known capacitor, in series with a 50 ohm load across the "unknown" arm of the bridge. When XC=XL, then the two reactances cancel (assuming they approximate to an ideal reactance) and load presented to the bridge by the RLC circuit = 50 ohms. Thus you tune the system to best return loss which is a null and calculate XL at this frequency You can even do this at the end of a section of 50 ohm coax, assuming the loss isnt too great

No doubt all you RF experts out there have known about this for a long time - has it been published as an idea before?

Richard

A "nibler", a one-hand operated, very short-bladed shears is useful. You can
also guide this tool round curves in sheet metal similar to a pair of
sissors if needed.

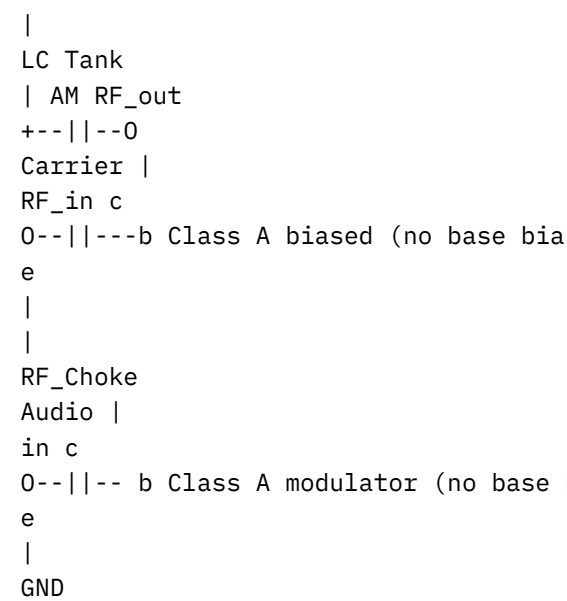
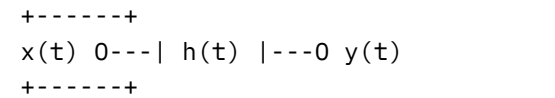
> or, a pulse amplitude modulator if its rails are varying.

Here's a "class-A" amplifier that can be amplitude modulated but yet not saturated (assumes a constant load R):



This is a single ended amplitude modulator. The top transistor could be driven to the switch mode by the carrier, but this is not necessary to produce AM. Practically, it will be driven to the switch mode for efficiency reasons.

Amplitude modulation can be "made" via linear methods. "Multipliers" cannot be generally stated to be either linear or non-linear. A system which includes a multiplier must be put through the linearity test to see if the configuration is linear or non-linear. IOW, it can be either.



linearity:

aï¿½x1(t) => aï¿½y1(t)
bï¿½x2(t) => bï¿½y2(t)

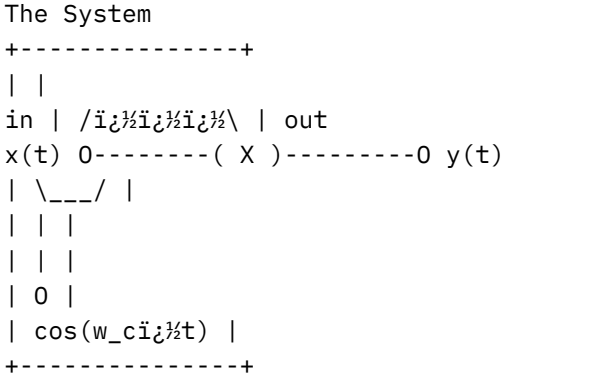
if x(t) = aï¿½x1(t) + bï¿½x2(t)

then

y(t) = aï¿½y1(t) + bï¿½y2(t)

If that is true, then the system is linear. This can be true for
systems with multipliers.

This system is linear and has a multiplier (it is not time invariant):



It produces a DSB signal (y(t)). w_cï¿½t could be "added in later"
(linearly) to y(t) in the proper amplitude and phase and the resultant
signal would for all practical purposes be indistiguishable from
standard AM. No non-linear circuit was used but yet AM was produced.
Not convenient, but it does dispel the "non-linearity is required"
myth. Also, a multiplier can be viewed as a MISO system.

And you think that this is me to me? I suppose you aint read many of my
10,000+ posts.

Err..you've missed the cap from the top transistor emitter to ground. If
the bottom transistor circuit was a true current source at rf, the top
transistor could not effect the output current at all.

Oh, and its not very linear with required to audio input signal without
an emitter resister anyway. The distortion of an basic tranister amp for
2nd Harmonic = Vi(mv)%, that is 10 mv will get you 10% distortion.

>
> Amplitude modulation can be "made" via linear methods.

Nope. Not a chance.

>"Multipliers"
> cannot be generally stated to be either linear or non-linear.

If one input of a multiplier is held constant, the other input has a
linear response. If the other input is a function of time, the response
to the first input is non-linear. That is, it dose *not* satisfy a(f(t))
= f(at).

The above circuit relies on the fact that the "re" of the top
transistor, is a function of its emitter current set by the bottom
transistor, via the equation re=1/40.Ic. e.g. see
http://www.anasoft.co.uk/EE/index.html

> A system which includes a multiplier must be put through the linearity
> test to see if the configuration is linear or non-linear. IOW, it

> then
>
> y(t) = a*y1(t) + b*y2(t)

Linearity can more easily be expressed as:

a(f(t)) = f(at)

>
> If that is true, then the system is linear. This can be true for
> systems with multipliers.

Nope. A signal being acted on by a multiplier is a non-linear system if
the second input is non constant with time. Your way of base on this
one.

>

This is not a linear circuit. You need to understand what linear means.
A linear system, cannot produce frequencies that are not in the input,
essentially, by definition. With all due respect, I would guess you
don't have an EE B.S. degree. This is all pretty basic stuff really.

>No non-linear circuit was used but yet AM was produced.

Nonsense. Your pretty misguided on this. You can not achieve
multiplication without a non-linear circuit. For example, Gilbert
multipliers use the fact that Id=Is.exp(vd/Vt). That is it logs, adds
and antilog. Balanced switching mixers use switches. Fet mixers use
their square law response.

> Not convenient, but it does dispel the "non-linearity is required"
> myth.

Its not a myth. I know of no way whatsoever to generate an analogue multiplication x product terms without having a device satisfying the property of a.f(t) != f(at), i.e. a non-linear device. Please feel free to suggest one, but file your patent first.

If you're really interested in getting it right, it should have been:

> Oh, by the way...you're trying to teach your granny to suck eggs son.

"You're" is a contraction for "you are".
"Your" is an adjective, meaning "of or relating to you or yourself".

And a comma would have been appropriate between "eggs" and "son", making
it better yet if it had read:

> Oh, by the way...you're trying to teach your granny to suck eggs, son.

Roy Lewallen, W7EL

==========

Joe , May I suggest you consider the following method :

--Take 2 pieces of angle iron (say 75 x 75 mm , 3x3 inches) ,or larger with a length of at least the length of the cut to be made.

-- Place the 2 lengths flange to flange and drill 2 or more holes (depending on overall length) and bolt them together with washers in between ; the total washer(s) thickness being a fraction more than that of the hack saw blade thickness .

-- Place the bolted flanges in a vice ,such that the other (spaced)flanges form a horizontal platform .

--- Clamp the sheet metal to be cut to the horizontal flanges and make your cut, using the opening as a guide

Note : With a normal U-frame hack saw you would cut the washers and bolts (depending on the blade operating angle), unless to move the clamped sheet metal .
However it is better to use a knife type holder for the hack saw blade , a low cost tool available from most DIY stores.
With this tool ,which only holds one end of the blade you avoid hitting the washers (and bolts) while making a straight cut

Good Luck

Frank GM0CSZ / KN6WH

Joe, I use a Stanley Knife and a straightedge. Score the aluminium
about 1 - 2 mm outside the finished line until you see a faint ripple
on the opposite side, the score is about 1/3rd the sheet thickness.
The ali will break along this fracture in a clean and tidy manner,
with big, 6 foot or so, sheets place the score on the bench edge
before breaking . No Noise, no fileings while cutting etc, and its a
lot quicker. you will need to finish off the edge with a file "to fit"
just my ha'penny worth.

Source record: 32884

Hello all,
I've already done a post a few days ago about a PLL system I had build. The initial problem was almost solved, but it isn't yet perfect.
In fact I made a PLL with a MC145152 IC, that I added to an existing VCO (see http://www.mcarsweb.com/_divers/schematic_from_motorola_application-note_98). It works quite well but the output signal, that is fed into the VCO, is varying a bit at a frequency of about 187 KHz (http://www.mcarsweb.com/_divers/oscillo.jpg the vertical scale is enlarged). I don't know if I should adjust the filter values, or add a additional small filter just before the VCO (with a resistor and a capacitor between the output and the ground).

What do you think about that ?

Thanks in advance for your answers ;-)

Damien

1668. HP8640B output amplifier failure

Newsgroup: rec.radio.amateur.homebrew

Help!

I want to effectively "jam" CB reception on my property.
The "jammer" would need to be low power and cover an area about as large as a 'small' city block.

I have searched google, but I have only found references to schematics that were either posted to usenet as a picture (thus not saved in google archives), or located on web servers in domains that no longer exist.

Any information would be appreciated!

1671. Re: want circuit/schematic for CB "jammer"

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-05 17:54:24 UTC
From: limitedselection@aol.com
Message-ID: <20030905135424.07383.00000642@mb-m27.aol.com>
Source record: 32888

To "Caveat Lector":

Thanks for your 'help'!

Apparently you are a lawyer (or play one on usenet)?

Somehow I don't think the FCC would fine me for jamming CB reception on my own property.
I specifically asked for a low power circuit that would only cover the area around my house - not powerful enough to reach the neighbors.
Since I would be jamming myself I would not complain.
Since it's my property the FCC would not know I was doing it - if they drove up to my gate it specifically says "No Trespassing - violaters will be prosecuted".

Since the signal would not leave my property, and there would be no complaints, and it would not interfere with anyone other than me, and to detect the jamming signal you would have to trespass on my land (at your peril) - I assume that I could 'get away' with it.

Again, any help (other than legal advice) would be greatly appreciated!

1672. Re: Phase modulated carrier thru rf amp tank circuit??

Newsgroup: rec.radio.amateur.homebrew

Source record: 32889

Thanks for your response. I am struggling with this. I still have trouble visualizing how a 180 or 270 degree change can occur in a single rf cycle and be able to overcome the "inertia" (probably a poor choice of words) of the rf circuits , feed line and antenna system. These are large abrupt changes, not more suttle changes like i would expect relative to voice modulation. I have read that in some amplifiers the tank provides the other half of a single rf cycle. Why wouldnt the same the action interfere with a phase shift in a rf cycle. I could understand being able to detect a phase shift after a given period of time with respect to a previous period. The period being relatively long compared to the rf cycle time.

You are talking about the groundwave, think about the skywave.
I can assure you that even a low power jammer will be receivable over
most of the world at some stage or other, depending on propagation
conditions.

I won't offer legal advice, but I can offer technical advice.

There's no way to make a signal stop at your property line, short of putting a perfect shield around your property. And if you did that, you wouldn't be bothered by your neighbor's CB anyway.

It also looks like you might misunderstand what "jamming" does and how it works. There's no practical way to make interference go away by "jamming". "Jamming" is a masking technique. For example, the communist bloc nations used to jam Western broadcasts, with high-power transmitters placed close to the intended audience, and producing powerful noise-like signals. So all the intended audience could hear is the noise, and not the Western broadcasts. If you build a local jammer, you'll simply hear it instead of the CBer. That is, you'll just be replacing the interference he causes with interference you cause. You can accomplish the same thing by running the jamming signal modulation into some earphones, putting them on, and turning off the radio the CBer is interfering with.

Ah, I had not thought of that. Is there any way to ensure that did not happen?
Locating the jammer inside the house?
The angle of the antenna?
Sheilding the jamming device?
Only operating at certain times?

I do NOT want to interfere with any reception (other than my own).

Frank,
In my post I was asking for a jammer that would only cover an area around the house - not powerful enough to reach the perimeter of the property.
So, the signal would stay on my property because it was radiating from the center at very low power - while the CB signals were broadcast at very high power and essentially cover my property.

Mike informed me that due to sky waves any signal - no matter how small - will be heard all over the place.

Thanks.

Roy,
Thanks - Mike posted about sky waves (I was unaware of), so even a very low power device centrally located in my property would apparently be heard world-wide - which is NOT what I want.

Actually, I did want to jam the reception of the existing CB signals on my property (at least in and around the house).

One of my neighbors uses rather 'salty' language and the local kids use some walkie talkies around the house - I fugured that jamming the outside signals would still allow the kids to talk due to their close proximity.

Thanks again.

Source record: 32896

Well Jamming is defined as "Intentional Intereference" and as I advised you
it is illegal in case you didn't know.

Now it sounds like u are trying to keep the CB signal from entering your
property -- that is not jamming -- that is termed Shielding"

And there is no practical way to do that.

Further should you radiate a very low level signal -- when the 29MHz band
has good nproagation -- you will send even a low level milliwatt signal for
hundreds of miles via "skywave" (skip if you will)

So tell us what u are trying to do and why and perhaps we can help

And it is helpful to know what is legal and what is not !!

Get FRS radios for the kids. They are cheap, reliable, and will NOT receive
standard CB transmissions.

Troglodite,
Actually - I purchased a few sets of FRS radios over the last few years.
At first FRS was great! After about a year it got to be very CB 'just after Christmas' like. Then it started getting kind of creepy.
I don't know what FRS is like where you are, but around here there seem to be a lot of grown men who know that children use FRS radios and like to talk to them and 'make friends' - scary.
Of course the kids are all online and know not to 'talk' to strangers or even give them their names/locations - but it's still a little creepy.
I was amazed last year I turned on one of the FRS radios and started playing around with it and heard activity on 4 different channels (and I don't live in a big city).

Recently we were driving and one of my kids were playing with an FRS radio as we were driving down the highway. He was talking to his cousin in another car. Suddenly we heard someone else talking - it turned out to be another car on the highway that was passing us! Too weird.

Anyway - the CB walkies also work better (signal wise) than the FRS radios. I was going to check out GMRS, but that seems to be as saturated as FRS.

Thanks.

Maybe MURS - but money is an issue too.

Hm, that is an interesting problem. The trick would be to have a signal that's always considerably stronger at the walkie-talkies than the CBer's, regardless of where they might be in the house or on the property, but always considerably weaker than the signal from the other walkie-talkie. That won't be easy, if it's possible at all. Your best shot would be to use another walkie-talkie, because it would be directly radiating on the right frequency. It'd also be legal, for what that's worth to you. You'd need to reduce its signal output by shielding, cutting down the antenna, reducing the battery voltage, or some other means like stringing ferrite cores over the antenna. But I wouldn't bet on its accomplishing what you're trying to do, unless the CB interference is pretty weak. Reducing the walkie-talkie receiver sensitivity is another option, if the receiver is separately accessible internally and you know enough about such things to do it. But I think the best idea, suggested by another poster, is to contact the FCC. The law can, occasionally, be used to your advantage.

From: Roy Lewallen <w7el@eznec.com>
Message-ID: <vlhsm9okcuhe08@corp.supernews.com>
Source record: 32802

"Inertia" is a relative thing. Consider a one-cylinder motor with no flywheel at all (imagining it could still run). The crankshaft rotation would be very jerky, wouldn't it? Now put a small flywheel on it. The jerks wouldn't be as abrupt, but the rotation would still be jerky. As you make the flywheel bigger and bigger, the jerks smooth out, but the flywheel has to get really big before the rotational speed becomes, for all practical purposes, constant, without varying some during each rotation. That's a pretty good analogy. A low-Q tank circuit is like the little flywheel, and a high-Q tank like a big flywheel.

A tank that provides the other half of an RF cycle does interfere with abrupt phase changes. But the circuit can usually be designed to provide enough restoration of the carrier sine wave while retaining enough of the modulation characteristic to be useful. Also, a single-resonator tank circuit isn't the only trick in the engineer's bag. More complex filters, such as multiple pole bandpass and lowpass filters, can be designed that are much more selective in what they do than a simple single LC tank circuit.

The larger and more abrupt the changes, the more careful and clever the designer has to be. But the design of wideband modulation systems is well within the capabilities of a competent RF engineer.

If you have an oscilloscope and a signal generator capable of being frequency modulated, you can run some experiments with LC circuits and filters that should be quite educational. And a spectrum analyzer would enhance the educational value considerably.

Roy,
Originally I was thinking build a small low-power jamming device and locate it in the center of the house. Then the field area being jammed would hopefully surround the house - but not extend out too far. Being as it was located inside I was assuming that the signal would not be as strong as the walkie to walkie signals outside.

Someone else suggested jamming the tranmitter's receiver (I like that idea!). They were talking about using a mobile with a car battery and a magnet antenna inside a garbage bag. Any CB jamming device schematics around (I would hate to lose a real radio).

Someone suggested via email that if the walkie talkies were crystal rather than PLL you could swap the two crystals and the radio would be below channel 1 on a 'funny' channel. I tried swapping crystals on one and it was definately on a different channel - I then swapped them in another one and the two could talk again - but I couldn't hear them on one I hadn't swapped the crystals on. I found them on my shortwave receiver down below channel 1. This may work out.

The FCC was not interested in the situation. It might be different if a bunch of people complained about the same person, I don't know - but apparently one person complaining means very little to them.

So far the crystal swapping may be the best way out - they get to keep the CB walkie talkies which are better than the FRS radios I have (range/reception) - but it is very quiet on the new channel!

I would still be interested in any schematics for jamming circuits though.

Thanks again.

A quick Google on "hp part cross-reference" was productive, and the
first hit may yield the answer Harke needs:

JD,
Thanks for the story. I would prefer to use some cheap throw-away little
circuit instead of 'good' equipment though.

An email I received told a story about a guy building a small jamming circuit
and then using a slingshot to launch it onto the target roof. The guy had made
a small parachute (like those little army men toys) to slow it's fall. The
circuit was encased in an egg shaped container (Silly Putty maybe) so it rolled
down and ended up in the rain gutter - where it sat. Apparently the gutter
sheilded the signal from the ground making it nearly impossible to locate the
device. According to the story they were searching for it with field strength
meters and such and never found it - until the next rain ... but by then it was
long dead anyway.

Thanks again.

Looks like Agilent has a replacement part:

Part Part Description
Number Reference Used In Price Part
Category
5086-7068
[Obsolete] ORD-08640-67002
Status : No Longer Orderable.
Type : New support part for which Agilent
owns the design specifications.

Replaced By 08640-67002, which is no longer orderable. They'll
exchange for a (? refurbished) part.

I found this at <http://www.parts.agilent.com/>, after a little
digging.

If you _do_ do the exchange, please let us know how it turns
out and what neighborhood the price was in. My 8640B will die
one of these days, too.

It's almost impossible to diagnose PLL misbehavior without a spectrum
analyzer, or at least a receiver that will let you listen to the output
signal. What does it sound like in a receiver?

What's the reference frequency (the frequency at which the phase
comparison is taking place?) It wouldn't be 187 kHz, would it?

Indeed. There are amateurs that compete to contact every country in
the world on just one Watt or less, believe it or not. Radio is a most
amazingly efficient form of communication. There are differences,
however, between the CB frequencies, which are relatively low, and the
higher ones. CB frequency transmissions, even at very low power, can
go world-wide very readily during and around sunspot maxima. There's
much more to it than an outsider might imagine.

Dick,
That I am ... I ASSumed that it would not be a problem to ask for this. From a google search I had done I saw that this did come up from time to time - but usually the schematic was posted as a jpg - which google does not retain. Occassionally there was a URL pointing to the location of schematics - but these all refer to non-existant domains - or non-existant pages now. I ASSumed that I could just ask and someone might have the information.
Apparently giving this information to someone is a crime according to some of the replies I have received. Apparently asking for this information is a crime according to other replies I have received. Apparently even thinking about this topic is a crime according to some of the replies I have received.

So, to all who I did offend by asking for this information I apologize for my thought-crime.

Big Brother loves you all.

True. It should be there.

> Oh, and its not very linear with required to audio input signal without
> an emitter resister anyway. The distortion of an basic tranister amp for
> 2nd Harmonic = Vi(mv)%, that is 10 mv will get you 10% distortion.

The point wasn't to design a perfect amp. The point was to illustrate
you're wrong.

> > Amplitude modulation can be "made" via linear methods.

> = f(at).

No, false, or whatever negation pleases you best. You were already
given the answer. You confuse time-invariance with linearity. You need
not take my word for it. Consult any Signals and Sytems text, any
Linear Systems text, or any Communications text. IIRC, the following
was a homework problem in Stremler's text:

Determine linearity
Determine time-invariance

The System
+---------------+
| |
in | /ï¿½ï¿½ï¿½\ | out
x(t) O--------(X)---------O y(t)

```
| \___/ |
| | |
| | |
| O |
| cos(w_cï¿½t) |
+---------------+
```

http://www.amazon.com/exec/obidos/tg/detail/-/0201184982/qid=1062815444/sr=1-1/ref=sr_1_1/102-5544036-9325762?v=glance&s=books

I suppose if you want to make up your own definition of linearity, you can get whatever anwswer you wish.

> > A system which includes a multiplier must be put through the linearity
> > test to see if the configuration is linear or non-linear. IOW, it
> > can be either.
>
> Ho humm again. You confuse where the term linearity is to be applied.

I defined the system quite clearly. I mean, I don't think it can be made simpler.

You can stick with the formal definition given in pretty much every Signals and Sytems text, any Linear Systems text, or any Communications text, or you can make up your own and get the answer that pleases you.

> > +------+
> > x(t) O---| h(t) |---O y(t)

Except that isn't "the" definition (hey, but it is true if a = 1). It doesn't even meet you own description:
"A linear system, cannot produce frequencies that are not in the input, essentially, by definition." -- Kevin Aylward

I would like to see you apply this "definition."

> > If that is true, then the system is linear. This can be true for

Again, you confuse linearity and time-invariance.

> > This system is linear and has a multiplier (it is not time invariant):
> >
>
> Nope, its not.

Oh, but it is. Some rather trivial math can lead you to understand what
linear means.

> > The System
> > +---------------+

You don't know what linear means. There it is.

> With all due respect, I would guess you
> don't have an EE B.S. degree.

Cut the chest puffing.

> This is all pretty basic stuff really.

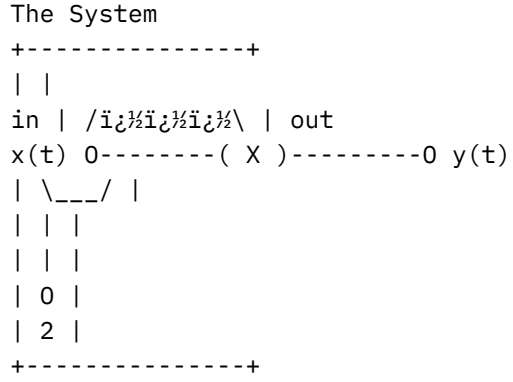
On that much we certainly agree, Comm101 ought to do it.

> >No non-linear circuit was used but yet AM was produced.
>
> Nonsense. Your pretty misguided on this.

Well I won't take you word for it, and you need not take mine. You
could make it easy just by applying the linearity test. That is,
linearity as it is defined in every Signals and Sytems text, any Linear
Systems text, or any Communications text. I'm not as "original" as you,
I simply trust the guys who wrote the books.

> You can not achieve
> multiplication without a non-linear circuit.

How about this one:



It looks functionally to be an amp with a gain of two. Is a "gain of 2"
circuit non-linear? Isn't that a multiplier in there?

> For example, Gilbert
> multipliers use the fact that Id=Is.exp(vd/Vt).

I think that descibes pretty much every bipolar. So I guess transistor
amps cannot be made linear, or at least function sufficiently linear for
the purpose of electronic designers. That is an "interesting"
contention.

> That is it logs, adds
> and antilog. Balanced switching mixers use switches. Fet mixers use
> their square law response.
>
> > Not convenient, but it does dispel the "non-linearity is required"

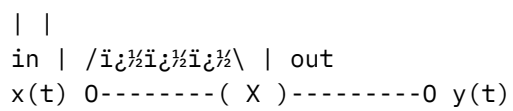
> multiplication x product terms without having a device satisfying the
> property of a.f(t) != f(at), i.e. a non-linear device. Please feel free
> to suggest one, but file your patent first.

Why not dispense with the snidery, and simply prove your contention by
applying the linearity test to this one:



```
| \___/ |
| | |
| | |
| O |
| cos(w_cï¿½t) |
+---------------+
```

Hey, I'll even give you a hint.

Let x1(t) = a1ï¿½cos(w1ï¿½t)
x2(t) = a2ï¿½cos(w2ï¿½t)

Then y1(t) = a1ï¿½cos([wc + w1]ï¿½t)/2 + a1ï¿½cos([wc - w1]ï¿½t)/2
y2(t) = a2ï¿½cos([wc + w1]ï¿½t)/2 + a2ï¿½cos([wc - w1]ï¿½t)/2

?
If x(t) = x1(t) + x2(t) does y(t) = y1(t) + y2(t)
(This *is* the linearity test.)

?
[x1(t) + x2(t)]ï¿½cos(wcï¿½t) = x1(t)ï¿½cos(wcï¿½t) + x2(t)ï¿½cos(wcï¿½t) = y(t)

The answer is yes: the system is linear, by the linearity test.

If x(t) = aï¿½cos(wï¿½t) is applied to the system,
and produces y(t), does x(t-to) applied to the
system result in y(t) except all the t's are
replaced by t-to? (May all the t's in
the y(t) case be replaced by t-to, and
have the system response reflect that the input
was x(t-to).) (This is the time-invariance test.)

y(t) = x(t)ï¿½cos(wcï¿½t) = aï¿½cos(wï¿½t)ï¿½cos(wcï¿½t)
= aï¿½cos([wc + w]ï¿½t)/2 + aï¿½cos([wc - w]ï¿½t)/2

Now put the "to" into the input and see what
comes out

What? = x(t-to)ï¿½cos(wcï¿½t) = aï¿½cos(wï¿½[t-to])ï¿½cos(wcï¿½t)
= aï¿½cos([wcï¿½t + wï¿½[t-to])/2 + aï¿½cos([wcï¿½t - wï¿½[t-to])/2
| |
+--------------------------+
not t-to,

So the system is *not* time-invariant.

This is Comm101 stuff, if you're ever interested enough to crack a book
open, and actually work the problems.

> Oh, by the way...your trying to teach your granny to such eggs son.

You're wrong about that one too: we have no relationship. I hope that
comforts you, as I know it does me.

Damien
There are two main possibilities (and a few others as John Miles says)
First the 187 KHz could be a reference spur if that is the comparison
frequency. I note you are using a 10.24 MHz clock. What is the R (reference
divider) ratio and main N ratio? These will be entered by software or
hardwiring/switching various pins. If the signal is a reference spur than it
could be attenuated by an additional pole (RC network) before the VCO
A single RC pole will attenuate at 6dB/octave above its corner (3dB) freq,
so to get any sort of attenuation, the pole will have to set at about 1/10
of the unwanted signal/reference (say 20 KHz) or lower.

Alternatively the signal could mean the loop is unstable, in which case you
might have to go back to design basics
How did you arrive at the values for the loop filter?

Richard

I wish I had thought of it earlier but there is a company that makes printed circuit boards call Far Circuits http://www.farcircuits.net/ The problem is they don't sell kits. Even if you don't have the construction article the project comes from, they will be happy to sell you a copy of the article for a small fee.
I have even seen books on electronic science fair projects and books electronic projects for beginners. Look around and ask around.

I hardly think this would be a problem. For one, you'd need an antenna
radiating a large proportion of skywave. Second, the CB bands are loaded
with all kinds of open carriers, whistlers, music players, etc. so your
tiny part in this would be unlikely to harm anyone.

Anything you might do to jam this CBer (like an oscillator to transmit an
OC) would also jam the walkie talkies.

1. Change the channel the walkie talkies operate on, or

2. Replace them with walkie talkies using another band. I believe there are
walkies talkies that also operate around 49 MHz.

This is ridiculous. Try talking skip even on a car CB putting out legal
power. It ain't gonna happen.

Beside, the solar cycle is on it's downward spiral, and skip openings on 29
MHz are going to become few and far between and the cycle deepens.

If your local CBer is primarily a "skip" talker, that in itself might take
him out.

Donut,
Thanks for the info. Earlier someone suggested using a mobile CB with a car battery and a magnet antenna and a garbage bag - and placing this as close to the neighbor antenna as possible.
I think building a low-power jammer and placing it close to his antenna would be a better solution. Less expensive and totally disposable.
You are one of the few people on Earth (well, at least on usenet - on usenet so far since I posted yesterday) that seems to think that this would be relatively harmless. Other people are equating asking for a jammer schematic to asking for information on manufacturing chemical/biological/nuclear weapons (it probably sounds like I am kidding about this - but I am NOT).
Thank you for your rational/calm approach to this!

Donut,
Thanks for the info.

I am just looking for a low power, low cost (cheap) and disposable cb jammer
circuit.

A lot of amatuer radio operators and RF engineers are telling me that such a
device could wreak havoc world-wide even though it would be mere mw in power.
According to them 'skywaves' would allow the jammer to reach the entire planet
and jam communications world-wide.

I certainly don't want to jam world-wide communications, so unless someone has
a 'safe' schematic I am out of luck I guess.

Thanks again donut!

1705. Re: Phase-locked loop filter

Source record: 32822

Hello,
About the quartz, I haven't used a 10.24MHz one as in the given schematic, but a 5.12 MHz one. The R ratio is 1024, so the reference frequency is 5 KHz. The N ratio used is from 196 to 284 (with the 64/65 prescaler; VCO goes from 63 to 91 MHz). I don't think the loop is unstable, because the VCO output is quite clean (only a bit blur, see http://www.mcarsweb.com/_divers/vco.jpg).
The loop filter values have been calculated with the fomulas given in the motorola application note 980.

So, if you think I should use a additional RC network, could you tell me how to calculate the values :-$?
Thank you ;-)

Damien

1706. Debugging of LC Bandpass Filters

Message-ID: <2c04c006.0309060123.7222e1bc@posting.google.com>
Source record: 32823

Hi all,
In the past many people on the board have help me solve some
related problems. Thanks to all.

I want to know what is the procedure to find the problem with a
fabricated and assembled board. I have two kinds of filters on my
board
1) Coupled resonator filter of 4 order (differential). I have
simulated the circuit in spice and checked the waveforms at all
points. They do not match. May be because of parasitics. (inductor SRF
is large) or may some other reason I dont know of. I am observing
through a single ended cable.
2) LC butterworth/cheby filter BPF: Should I check the waveforms at
the resonant frequecies. Should I assemble the board in particular
sequence.

Q) Are there any general methods of making sure that the LC BPF
circuits will work.

No its correct. If the second input is time varying the output of the
system is *not* a linear function of the first input. Its that simple.

I do. It makes a reasonably good practical definition.

>> this one.
>
> Again, you confuse linearity and time-invariance.

Nope. I agree, if, for example, a second input is constant in time, a
circuit can be linear, however, if a second input changes the gain of
the first signal then the output is no longer a simple gain + offset,
therefore, the system in non-linear. The output is not a "simple"
function of the input.

However, I agree, "I suppose if you want to make up your own definition
of linearity you can get whatever answer you wish."

>
>>> This system is linear and has a multiplier (it is not time

Ho hum sniped.

>
>>> No non-linear circuit was used but yet AM was produced.
>>
>> Nonsense. Your pretty misguided on this.
>
> Well I won't take you word for it, and you need not take mine.

I don't. Its 101 transistor electronics that the collector current
follows the base voltage by an exponential relation. The class A amp you
showed achieved multiplication because:

gm=40.Ic. because gm=di/dv, directly obtained from I=io.exp(Vb/Vt)

So that Vo=40.Ic.Vc

therefore

Vo = 40.Vc.Vi/Re

So, the modulation is achieved precisely because the transistor is
non-linear. This clearly contradicts your claim that your stated class A
amp is a modulator without using non linear properties.

Please present your detailed, alternative argument to support your claim
that your class A amp does not rely on non linearity to achieve
modulation, and why my 101 analysis, as given above, is false.

You
> could make it easy just by applying the linearity test. That is,
> linearity as it is defined in every Signals and Sytems text, any

> +--------------+
>
> It looks functionally to be an amp with a gain of two. Is a "gain of
> 2" circuit non-linear? Isn't that a multiplier in there?

Your grasping at straws here. This is trivially not the point. Of course a fixed, or constant gain on a signal is linear. Jesus wept dude. No brownie points for you on this one, I'm afraid. It was clear from the start that one is referring to varying multiplication.

>
>> For example, Gilbert
>> multipliers use the fact that Id=Is.exp(vd/Vt).
>
> I think that descibes pretty much every bipolar. So I guess

> sufficiently linear for the purpose of electronic designers. That is
> an "interesting" contention.

Out to lunch again. Of course transistors amps can be made as linear as desired, I made no such connotation. Again, your making up what I say as you go along because you arguments are so weak.

My point on the class A, non clipping, amp modulator you showed above, it that it *relies* *explicitly* on the non-linear transfer function to achieve multiplication.

Again, present your theoretical argument as to how AM modulation actually occurs in said amplifier, without using any properties derived from any non-linear behaviour.

>

>
> Why not dispense with the snidery, and simply prove your contention by
> applying the linearity test to this one:

I must confess here I made a small error. Contrary to my claim of ignorance, I am in fact aware of a modulating technique that dose not rely, it would appear, on a devices non linearity, and have been so aware for a considerable time, but it slipped my mind. A light dependant resistor and a light bulb would seem to satisfy this requirement. I suspect the claim would have to be modified to a direct electrical method. I await you providing an example.

Source record: 32826

Weeeeellllll, if you are trying to avoid interference from a nasty and illegal high power CB transmitter nearby, perhaps a little story may help give you ideas.

Once upon a time, not so very long ago (about fifteen years or so) I lived in a large metropolitan area in the nation of Californica and enjoyed operating low power, and particularly liked shortwave dx listening. However, there was this miscreant that lived about a mile from me and below my location that had a large antenna in his yard, and seemed to be talking a lot of "good buddy" type of talk, along with a bunch of trash talk (using words I hadn't heard in anything near polite conversation in many a year), just about any time I was listening. It seemed as if he had no job and was on the radio 24 hours a day. It turned out I had some direction finding ham friends that were able to help me determine where he lived, and we did find his location. Of course, just driving around would have probably helped. He had a large quad array cut for 111 meters (CB) on a short tower in his back yard, with the tower bolted to the garage wall and roof.... Well, after monitoring his output and determining that he was indeed on the CB band, and having called and mailed the wonderful people at the FCC and the local constabulary for a couple of months running, no solution seemed apparent. Then one day, after more than a few beers, an unnamed friend was trying to listen to a ham across the valley (only some 20 miles away) on 10 meters, and the bad guy CB'er came on and trashed the whole band with his splatter. After a few more beers, the friend decided to do something about it, and a plan was hatched.... One day not so long after, someone unknown to both of us walked onto the property of the CB bad guy (probably illegally) and pushed some straight pins into his coax at several locations along the coax as it exited the house/garage and ran up the tower leg. Clipping the pins off at the surface of the coax jacket, he stealthily left the crime scene.

Several days later, upon discovering a party at the house next door, the same unnamed person invited himself in and had a conversation with the renter of the house. It seems that for the first time in months, he had been able to actually hear his stereo without trash talk emanating from it at odd hours, and was celebrating, treating (most of) the block to a good size keg of beer. It seems the CB neighbor had some sort of malfunction of a high power linear amp, and was threatening to sue the place that sold him the amp because it had failed quite spectacularly....

A month or so later, the area was still clear of the bad guy's interference, and as far as we know, no one ever found out why the amplifier failed...
<smile>

The moral? Don't go too far over the line, or there may be someone crazier than you that may cause you problems. Of course this works for the good guys too. Personally, I wouldn't condone this sort of behavior, and only found out later that the "pipe dream" of taking care of the bad guy had somehow become reality,

and how it had come about. Of course, given the current state of litigation in this country, you'd probably be arrested for _thinking_ about taking action against anyone, even if the "proper authorities" won't do diddly squat, not even thinking about actual physical action.

However, it may give one pause, especially if you happen to have some really crazy acquaintances..... and can positively identify the miscreant that is causing you a problem... of course, assuming he is actually beyond the bounds of legal operation...

Of course, jamming only complicates the issue, as it causes interference to all of _your_ neighbors too, as you cannot really contain any sort of jamming signal that would be effective in your area without putting signal beyond the boundaries of your own property. Even a fairly small signal can travel quite large distances. After all, there are people that regularly communicate thousands of miles on only a couple of watts! Adding your own jamming signal only adds to the problem, and what you need is probably a solution that subracts the problem from the airwaves...

> gwhite wrote:
>> Kevin Aylward wrote:

In summary, there are differing concepts of what linearity is being understood to mean in the real world. A point was made that a class A transistor amp modulator achieves modulation via completely linear means. This is clearly not correct as was showed in my last post, and in engineering practise, its probably impossible to generate a modulation function, in a direct electrical circuit, without explicitly using an inherent nonlinearity of a device. One only has to look at any practical modulator. That is, modulation and non-linearity, is isomorphic in a practical sense. However, there is certainly a valid argument, that in a strict mathematical technical sense, a "linear" system can encompass a much wider class of systems all under the banner of "linear". This is pretty much obvious, for example, even a Bessel integral transform is a "linear" transform, but would actually severely distort a signal considerable. However, this extended view of "linear" has little do with real analogue circuits, where linear is generally accepted to mean linear gain with offset, and is a technicality that has little, or even no value at all. The point has been made, but there is yet to be any real physical example presented, where such a technical point has any practical merit in real circuits.

Have you concidered the DS1086 Spread Spectrum Econoscillator from
dallas Semiconductors.
A programmable Oscillator (between 260Khz and 130Mhz) with a
selectable 'dither' of either 2% or 4%) powered from a few AA cells
would last a very long time and would sit nicely in the grass by the
CBers Aerial and clutter up his comms very effectivly ;-)

Very Tongue in cheek... Mike W

The only problem with that is that CB is AM. As all pilots know, when two AM transmitters come on frequency, you end up hearing both (and if one is a bit off frequency, a loud squeal as well). FM has the "capture" effect where you only hear the strongest one (ideally).

The last time I asked Agilent for a replacement part (failed switching supply) it cost more than the analyzer. We used a ginned up ATX supply with some DC-DC converters.

And the reason "It ain't gonna happen" is that there are probably
hundreds of people doing the same thing on the same frequency so all you
end up hearing is noise. I have communicated to Great Britain using CW
and 300 milliwatts on 28 MHz, so don't tell me it ain't gonna happen.
By the same token, I can't talk to a buddy 100 miles away on 100 Watts
on 28 MHz since he is in the "skip zone" at 28 MHz.

Chest-puffing is one of Kev's more prominent character traits, I'm afraid. In fact one often gets the impression that his contributions to these threads is more contrived to show off his knowledge of electonics and mathematics than to help others out of pure, selfless altruism.
Anyway, personal insults aside, I for one am lurking with interest to see who prevails in this linearity argument. It's a pity some heavyweight like Win can't step in and judge who's in the right on this one but I rather suspect he has better things to do with his time. Sadly I haven't so will continue to read these posts with interest!

Yes, but it's a fact that these signals can and do end up thousands of
miles away where they cause enough general noise to interfere with
sensitive communications equipment. Just because you can't "talk skip"
effectively on low power doesn't mean your signals aren't screwing
things up for others around the world.

Hi again,

Thanks everyone for your ideas, all of which are noted. The sheet I sawed-up, to make some spacers for my garage door, was scrap #10 gauge aluminium scavenged from old surplus gear. It was just that I never seemed able to cut a straight line and wanted to tap into the wealth of metal-working experience in the group out there.

Hopefully I will do better next time by following your suggestions.

I'd have to totally disagree with that. It can and does happen all the time. The low sunspot cycle means it doesn't happen as often but there are still band openings and skip even at the bottom of the cycle.

> device could wreak havoc world-wide

It won't "wreak havoc" world-wide, but it is very likely that it will be heard on occasions long distances from your location - and it is illegal. Even if your signal is only heard by your neighbor, intestinally jamming him is not legal - even if what he is doing is also not legal. On the technical side, it is just not possible to generate a signal that will be strong enough to block his on your property while ensuring that your signal will not leave your property. It is not technically possible to control signal strengths (especially given that your talkies will be moving around the property) to the point that it will block the reception of his signal while letting your signals through without interference when using the same frequency.

FWIW, the cost of FRS radios has come down to the level of kid's walkie talkies. I recently bought a pair of Uniden FRS radios at WalMart for about $17 / pair. 27 MHz walkie talkies are still around $10 a pair. I gave 'em to my kids so they can keep in touch around the neighborhood.....

Not at all. The purpose of my contributions are as a means of getting attention to my product, thereby gaining me much Guinness.

>than to help others out of pure, selfless
> altruism.

Where on earth did you get this daft idea that I post for the good of the people? As I have noted many times, there is no such thing as selfless altruism, its all for ulterior motives. We are all inherently selfish. I absolute agree that everything I do is ultimately geared toward my self interest, or to be more exact, the self interest of my genes. I have never claimed otherwise. Anyone who claims that they take action for the benefit of others, at a net determinate to themselves are either, liars, fools, or deluded.

> Anyway, personal insults aside, I for one am lurking with interest to

With all due respect to you here, why do you suppose that Win, and with all due respect to Winfred, is more qualified than myself on electronics matters.?

> this one but I rather suspect he has better things to do with his
> time.

This one is easy. I'm right. As far as the class A amp goes, its a no contest. It can't possible form a modulator without relying on the non-linear behaviour of the transistor. Its not debatable. I have explained the details already.

Regarding the definition of linearity, it is an open book. There is no single absolute correct definition. What we have here is a play on words, where some one is claiming that his version of the word definition is the only valid one, even whem most don't use it that way.

A linear operator in mathematics, or linearity, is used in a different sense then it is used in analogue design. An object that satisfies the definition of a linear system in mathematics, is not one that is usually applicable to analogue design, and as used by, essentially, all analogue designers. The analogue definition of linearity is much more restrictive. For example, a linear amplifier in electronics is generally restricted to those amplifiers such that the output voltage or current is a simple constant times the input voltage or current, with or without an offset. That is, there is a *linear* = *straight* *line* relation between output and input. This is equivalent to requiring that the output only contains frequencies present at its input, i.e. no distortion. Some other mathematical definitions of linearity would not be so restrictive. For example, suppose a signal is fed through a magic analogue Fourier transform device that converts the input voltage to that of its Fourier transform. You would be hard pressed to get someone to agree that the output signal is not a gross distortion of its input, despite the fact that the Fourier transform is mathematically a linear transform. Sure, some high brow might like to claim that his definition is the "real" one, but words only mean what the majority means by them, and in this case, a "linear" system, is one with a straight/linear line relation between input and output.

Do you have a 5 kHz notch filter in the control voltage feeding your
VCO? It will reduce phase noise in the output. A simple L/C trap will
work, but either the coil or cap should be adjustable for maximum
rejection.

You cannot control whether an antenna radiates a skywave or a groundwave. Even with controlling the takeoff angle, you will still get some radiation in other directions which means you will get some skywave propagation anyway.

Due to its frequency, groundwave on CB is not a useful propagation mode. 27mhz is high enough in frequency that it does not want to follow the curvature of the earth. It propagates mainly by "line of sight" (i.e. straight line) and/or skywave (i.e. skip).

Unfortunately the CB operator will probably think the solution is more
power. When he gets an occasional E skip propagation, he'll think he was
correct. His use of excessive power will then aggravate the situation.

Source record: 32844

A few years back, at an earlier employer, HP was buying back all of our 8640s dead or alive, refurbishing them, and sending them out to one of the Pacific Island countries, either Indonesia or Malaysia, in order to pull them out of circulation in the USA. I was also told that they were selling them on a no technical support basis. The really junky units were sold at the Inventory Disposal store for 25 dollars apiece. Surprisingly, out of the 50 or so that they sold, there were about 15 good ones.
On another note, I had an 8112 pulse generator that had a bad PLL chip. The folks at HP stated that they didn't have any replacement parts on hand, but if we would send it in, the would pull a part off one of their "boneyard" units.
I do remember that output amplifier in the 8640; it looks like a gold colored TO-3 device. You might be able to use one of the newer CATV amplifier modules as a replacement output amp. I don't remember if the power control voltage is applied to the output amp module or one of the earlier stages, though.
I am hoping that my Boonton 103D doesn't die, either. This unit uses a discontinued Optimax amplifier module in the output stage.

I had used that chip for several years, with a 2.5kHz reference frequency, and never ran into those kinds of problems. My first iteration of that synthesizer did have some high level reference sidebands (-40dBc), but after I redid the board with a top layer ground plane, all of the problems cleared up. Are you using a ground plane on your board? Are you also using that anti-slewing filter at the op-amp input, whereby you split one of the Rs, and use a shunt C between the two?
If you would like a schematic of my loop filter, give me a shout.

I disagree. You personally may well be motivated by selfishness as I
don't doubt are very many people. But to say that everyone's like you
is nonsense, quite frankly. There have been ample demonstrations of
others' ability to be helpful for no self-gain whatsoever on this
newsgroup alone. But I give you credit for making no bones about your
motivations anyway. :-)

I can't argue with any of that, but there again I'm no expert. I have
to say, though, that I've always found it very curious that radio hams
refer to their bolt-on, high-power, aftermarket boosters as "linear
amplifiers." You can't get any *less* linear than class C!
Or can you?

I don't have any ground plane. I only have a veroboard, which I took the unused tracks apart. I also don't have an "anti-slewing filter"; I first tried to do it but the output signal was very "unclean", so I removed the two capacitors. I'm now having two resistors in serial between the phase-detector and the op-amp, and it is much better.
I would be interested if you could mail me the schematic of your loop filter ;-) (mail it to damien.teney@mcarsweb.com)

Hmmm... A fixed 187 KHz spur sounds as if it might be an oscillation on the DC voltage regulator feeding the VCO. Although as has been mentioned, the op-amp in the loop filter could oscillate and cause similar symptoms.

Gary:

For the phase shift to occur during one RF cycle, wouldn't that suggest that the modulating frequency is close or equal to the RF carrier frequency? I don't think that is the situation you are trying to visualize. The modulating frequency, in voice or common digital modes, is more likely a tiny fraction of the RF carrier frequency. The phase shift of the RF carrier only has to occur at the modulating freqency, not at the RF frequency. That means that during the modulating phase shift, many thousands or even millions of RF cycles can occur.

If you are thinking of a mode like PSK 31, in which modulation is by phase shift, remember that the phase shift occurs in the audio tone that is modulating the RF signal. The RF signal can follow this phase change easily, since many millions of RF cycles occur during the audio phase shift.

Er.. we all are. Its explained in "The selfish gene" by Richard Dawkins.
Its a basic tenet of the modern theory of evolution.

>But to say that everyone's like you
> is nonsense, quite frankly.

Not at all. You must be one of the deluded ones. That is, you haven't
really thought about or studied evolution in enough detail. I am sure
you are genuine in this belief, but you are wrong. Of course, if you are
a believer in god or some other religion, then nothing I can say will
convince you otherwise.

> There have been ample demonstrations of
> others' ability to be helpful for no self-gain whatsoever on this
> newsgroup alone.

You miss the point. The term is *net* benefit or advantage. You need to
look at this *much* more deeply. Its only an illusion that one does
things for the benefit of others.

I have explained this quite a few times. Its based on the theory of
replicators.

Axioms:

1 Traits are passed on to offspring.
2 Traits are randamlly generated.
3 Traits are selected by the environment.

Now consider replicater A, that replicates *consistently* better than replicater B, say by 1%, due to a certain trait. After 1000 generations, what is the distribution of A/B?

This all takes time to explain in detail, but the gist is if any replicater takes an action that results in a *net* *final* disadvantage, the other replicators, will replicate themselves better. Its simple math. We can only observe the best replicators.

Obviously, it gets quite complicated, if doing some good to another, can result in a net beifit by returned favours, then a replicater will do so. Nevertheless its still inherently "selfish". In addition, a trait might not be consistently better, e.g. the larger one gets that enables one to fend for themselves better, is mitigated by the fact that one needs more food and other resources.

Have a look on the web for "the selfish gene" or get the book.

> But I give you credit for making no bones about your
> motivations anyway. :-)

I was not suggesting that I am always consciously doing things in a selfish manner. I am accepting the fact that its inherent from millions of years of evolution that we are all basically selfish, and there not much we can do about it.

Whilst, I do agree that Win is very knowledgeable and an expert, I am also an expert. I have been doing this rather a long time as well you know. The fact that I am not an academic is not relevant. In all honesty, there is not much I don't know about general analogue design, although, obviously, I don't claim to know it all. Does Win know more than me? Unlikely. Or do I know more than Win. Unlikely. However, we may well know different things.

But this part of it isnt. I gave the analysis of how the class A
modulator actually works. Its a fact. Its a standard and accepted result
by anyone knowledgably in the field.

I don't claim that gwhite's definition of linearity is inherently wrong,
only that it is not the one used in general analogue design. My argument
was not about the definition of linearity, it was about gwhite's claim
that his class A amp achieved a modulation function *without* relying on
the inherent non linearity of the transistors emitter current verses
vbe. This claim is absolutely false.

1736. Review: Ramsey HFRC-1 WWV receiver kit

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-06 19:52:44 UTC
From: shoppa@trailing-edge.com
Message-ID: <bec993c8.0309061152.284f3c@posting.google.com>
Source record: 32753
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

OK, it's not truly homebrew, but I bought a Ramsey HFRC-1 WWV receiver kit last week and put it together last night.

A little background: when I was in junior high I put a couple of Heathkits together. That's my total experience with commercial kits, and the experience is several decades old. Since then
I've done a lot of homebrewing, and I've bought-repaired-sold several used Heathkit rigs, but until this little radio, no more
kit building. By necessity I compare the Ramsey kit with Heathkit standards in a few places below.

It's a very basic 10 MHz superhet receiver in a smallish package. It has a built-in speaker (more on it below), power from battery or 12V adapater, and an antenna input and external speaker output. There's no tuning involved; it's a fixed-frequency receiver, and the only front panel controls are power on/off and volume.

The kit itself is $40, I added on a $15 case and paid another $7 or so in shipping. It arrived two days after I placed the order over the web.

PC board assembly was a breeze. The PC board was nicely laid out, the solder mask is excellent, and the instructions were straightforward and not too much different than a classic Heathkit. It took about an hour to stuff and solder the board.

Putting the PC board into the case was a slightly more difficult matter. The supplied speaker, if you put it on the PC board where there is space available for it, blocks the screws needed to assemble the little plastic case. Some RTV convinced the speaker to live elsewhere (glued to the top of the case). A Heathkit never would've been like that!

Similarly, with a Heathkit receiver they probably would've given me the plugs needed to run the radio. Instead a newbie without a junk box assembling this kit will have to run to Radio Shack to get the plugs for antenna and external speaker. Oh, well, Heathkit is no more, and my junk box had what was needed.

The receiver itself works great. I plugged a random longwire and ground into the little battery-powered receiver and instantly got ticks from WWV. There's a test point (or you can do it by ear) for tweaking two variable inductor transformers that do input matching and image rejection - those are the only RF adjustments that can be made.

So, while Ramsey clearly doesn't live up to the good old Heathkit standards in every way, it does come pretty close. The receiver was clearly designed with kit-building in mind, and it does work nicely.

Maybe I'll try one of Ramsey's QRP rigs next.

>out there.

Good chance it wasn't your technique, Joe. A hack saw that veers from the line you're trying to cut, despite gentle prodding in the right direction, is normally a sign of the kerfs being unequal on one side or the other, almost always a result of trying to use a worn blade past its "toss it" point. Most people have a left or right bias they introduce with their body motion, and that wears one edge more rapidly and/or changes the "set" of the kerfs to one side or another. Put a new blade in the saw and try it again.

If all you ever expect to use for this kind of work is a hack saw, then an investment in a good Lenox 4012 or equivalent high tension frame is a good one. You'll be absolutely amazed at the difference these late technology saws make over the old traditional types. Make sure the saw is capable of tensioning the blade to 30,000 psi or it isn't one of the new types.

A CRO display of the oscillator would not be very sensitive for showing sidebands, through it might show major problems. A spectrum analyser will be ideal if you have one (!) or a receiver to listen to the output. As your reference is 5 KHz, I agree that the cause is somewhere else - possibly an oscillation in one of the regulators as suggested by another poster. A 1uF cap close to input and output pins of the regulator to ground, with a short ground path will fix that.
PLL circuits are quite critical in terms of layout factors, as there is usually quite a high loop gain.
You certainly will run into problems if you use veroboard for a VHF PLL circuit - I suggest you layout at least the VCO "dead bug" style on a piece of copper board as a quick and dirty way of building a simple (or not so simple!) RF circuit.
There are several variuations on this theme - use small pieces of PCB hot glued to the plane as pads or use a small burr tool to isolate sections of PCB as pads with the surrounding copper remaining as the ground plane.
Ideally the VCO should be shielded and the whole circuit should be on a copper ground plane, with good bypassing and preferably separate regulators for the VCO, loop amp and PLL sections.
As for the maths of calculating a loop filter, I have always found it quite daunting as I am not professionally trained in electronics. The performance of the VCO will also affect the loop performance as one of the important parameters is the "VCO gain" ie the tuning sensitivity in MHz/Volt. There are various sites with articles on the topic - try the National Semi site for the best one in my view.

Richard

Why not get a pair of Motorola frs radio set (pair) at local store,
I just picked up a pair for $ 25 and a mail in rebate for $ 15 so low cost,
plus these are on uhf frequencies, no cb frequencies and low power.

Less expensive then trying to block the nasty guy on the cb.

Well when you've got it on 2meters and are feeding it with an FM rig,
of course it's silly to call it a "linear amplifier".

I have a surplus PLL pc board which has on board a Fujitsu MB1507 PLL chip, an OP123 op amp chip, and a Rockwell chip which I am unable to identity.

The device is a Rockwell 41404P-34HK, and appears to be in line with the rf feed from the VCO (external to the board) the rf input pin of the PLL chip. In this location the chip could likely be acting as a rf preamp or signal conditioner.

Apparently Rockwell spun their semiconductor division off to Conexant in 1998, but I can't find any info on the Conexant site.

I would appreciate any leads on this chip or a link to a datasheet.

Thanks

MikeN ZL1BNB

Hi,

I once pulled a faulty one apart to see what was in it. As I remember there was a pancake coil with some ferrite slabs attached (presumably for tuning), a couple of large SCRs or IGBTs, some large capacitors (film type I think), a small board with a handful of DIL chips and the power supply which was similar in topology to one you might find in a SMPS. I have a couple of Fairchild PDF files on the subject if you want them although they total about 500k un-zipped.

They are useful I find for their original purpose though. In fact I have one in my store cupboard for occasional use outside, in the workshop if I need to boil something up or as an extra cooking ring when everything else is occupied. Although you must use steel or cast iron pots on them (no aluminium, copper or al-clad), this is not a problem as inexpensive steel pots and pans abound.

Cheers - Joe

Er.. we all are. Its explained in "The selfish gene" by Richard Dawkins.
Its a basic tenet of the modern theory of evolution.

>But to say that everyone's like you
> is nonsense, quite frankly.

Not at all. You must be one of the deluded ones. That is, you haven't
really thought about or studied evolution in enough detail. I am sure
you are genuine in this belief, but you are wrong. Of course, if you are
a believer in god or some other religion, then nothing I can say will
convince you otherwise.

> There have been ample demonstrations of
> others' ability to be helpful for no self-gain whatsoever on this
> newsgroup alone.

You miss the point. The term is *net* benefit or advantage. You need to
look at this *much* more deeply. Its only an illusion that one does
things for the benefit of others.

I have explained this quite a few times. Its based on the theory of
replicators.

Axioms:

1 Traits are passed on to offspring.
2 Traits are randamlly generated.
3 Traits are selected by the environment.

Now consider replicater A, that replicates *consistently* better than replicater B, say by 1%, due to a certain trait. After 1000 generations, what is the distribution of A/B?

This all takes time to explain in detail, but the gist is if any replicater takes an action that results in a *net* *final* disadvantage, the other replicators, will replicate themselves better. Its simple math. We can only observe the best replicators.

Obviously, it gets quite complicated, if doing some good to another, can result in a net beifit by returned favours, then a replicater will do so. Nevertheless its still inherently "selfish". In addition, a trait might not be consistently better, e.g. the larger one gets that enables one to fend for themselves better, is mitigated by the fact that one needs more food and other resources.

Have a look on the web for "the selfish gene" or get the book.

> But I give you credit for making no bones about your
> motivations anyway. :-)

I was not suggesting that I am always consciously doing things in a selfish manner. I am accepting the fact that its inherent from millions of years of evolution that we are all basically selfish, and there not much we can do about it.

Whilst, I do agree that Win is very knowledgeable and an expert, I am also an expert. I have been doing this rather a long time as well you know. The fact that I am not an academic is not relevant. In all honesty, there is not much I don't know about general analogue design, although, obviously, I don't claim to know it all. Does Win know more than me? Unlikely. Or do I know more than Win. Unlikely. However, we may well know different things.

But this part of it isnt. I gave the analysis of how the class A
modulator actually works. Its a fact. Its a standard and accepted result
by anyone knowledgably in the field.

I don't claim that gwhite's definition of linearity is inherently wrong,
only that it is not the one used in general analogue design. My argument
was not about the definition of linearity, it was about gwhite's claim
that his class A amp achieved a modulation function *without* relying on
the inherent non linearity of the transistors emitter current verses
vbe. This claim is absolutely false.

And that illustrates the point very well. Linearity is up for grabs.
Just what is the term "linear" being applied to. The class c amplifier

is non linear in detailed operation but the envelope of the output is
still linearly related to the modulating input signal.

>> system.

A sudden phase shift like that (within one RF cycle) only happens if you phase modulate the carrier with a square wave, but then the tank circuit will even things out, but will still be quite a wide bandwidth.

You don't modulate any carrier in any mode using square waves to be honest - unless you pass that carrier thru a good filter after modulating it and before letting it loose. You should low-pass filter the modulating signal before letting it modulate the carrier - that way the phase change will be slow and not sudden as you were thinking.

Try Ten-Tec kits. (I don't think they get nearly enough press)

I built their 20m QRP kit a few years back. Nice unit. And very
reminiscent of Heathkit - in some ways even *better*. You build a chunk
of the circuit, then test it - so if you make a mistake, you don't have
to pull out layers of parts to fix it.

No he didn't. Of course, people tighten up or refine their original ideas a bit, but the fundamental principle is as sound today as when it was proposed. Its basic underpinnings are a tautology, therefore cannot be wrong.

> It's a magnificent book and probably the most important one anyone
> could ever read in their lives. I suggest you get a copy and study it
> carefully.

Err... already have it and read it. I didn't think it was as good. A lot of repeats of the selfish gene material. I would use all your words above to "the selfish gene" itself.

>While you're at it, get hold of Geoffrey Miller's the
> Mating Mind which is his brilliant refinement of the handicap
> principle in sexual selection - Darwin's 'other' theory.

The handicap principle is not really another principle. Its all accounted for in the *general* theory of replicators. Its just a matter of how the final numbers comes out in a detailed analysis. (see below)

>

I can't agree with this. It would appear that you don't understand the theory. If you did, you could not have possible made the statements you did about not being selfish. Its not possible. Its simple math. (see below)

I agree I can appear rather arrogant, but I do not do this for all issues. Only things I really know about.

>
>> You miss the point. The term is *net* benefit or advantage. You need
>> to look at this *much* more deeply. Its only an illusion that one
>> does things for the benefit of others.
>
> No. Dawkins recanted this. Read BW and MM.

This is nonsense. He didn't.

One must appreciate that Darwin did not know the specific mechanisms of evolution, and Dawkins, did not at first see the *general* bigger, picture of what genes were. The true "global" theory of "life" is not organisms, or genes or menes, its about Replicators. The Replicator is an *abstract* object from which general properties can be deduced about any object that satisfies the axioms of Replicators. The theory of replicators is correct by construction.

>
>> I have explained this quite a few times. Its based on the theory of
>> replicators.
>>
>> Axioms:
>
> [patronising lecture snipped]

If you actually understood those axioms, its a cut and dried case. The axioms lead to some absolute conclusions. *Anything* satisfying those axioms *must* result in its conclusions. All one has to do is to show some particular object satisfies those axioms. Its like mathematical group theory. One you show something satisfies the group axioms, its a done deal.

Look, given sets of Replicators, if any replicator is consistently better at replicating than another, given enough time, those particular Replicators *have* to dominate to the exclusion of all others. For example, a 1% advantage over 1000 generations, is 20,959. So if the

populations of the replicators were initially equal, after 1000 generations, the ratio would be 20,959/1. If a particular replicator, happens to aid another replicator'ss replication, at the net expense of its own, it must, by simple mathematics, be completely overrun by the replicators it has aided. Thus true and absolute "selfishness" can not be sustained in a system of a group of Replicators.

The theory also explains why people don't like to be thought of as selfish. Its abundantly clear that helping others, e.g in a group, is beneficial to the individual members own replication. For example, who has the best chance for avoiding a kick-in on the way home from the pub. A lone walker, or the gang of 5 skinheads.

The obvious issue with being too selfish, is that if you don't reciprocate help, people wont give you help back, such that you cannot replicate as well as those that do cooperate together. Indeed, this is an example of a "handicap". A first order mathematical analysis would indicate that helping others would be detrimental, i.e. that paricular trait is a handicap, when in fact a detailed mathematical analysis can show that net benefits are achieved from that trait. Its the final probability of improved replication that matters.

Fundamentally, we *all* *have* to be selfish at the root level. We are the result of the most successful Replicators, from millions and millions of years of evolution. It can't be any other way. Unfortunately, most can't like this simple fact, so deny it.

There is simple too much information. One just assumes that people are
using the same understanding for terms in a given context. e.g.
saturation in one context means normal operating conditions, in another,
it isn't. Indeed, in another it means the transistor got wet!

No he didn't. Of course, people tighten up or refine their original ideas a bit, but the fundamental principle is as sound today as when it was proposed. Its basic underpinnings are a tautology, therefore cannot be wrong.

> It's a magnificent book and probably the most important one anyone

Err... already have it and read it. I didn't think it was as good. A lot of repeats of the selfish gene material. I would use all your words above to "the selfish gene" itself.

>While you're at it, get hold of Geoffrey Miller's the
> Mating Mind which is his brilliant refinement of the handicap

The handicap principle is not really another principle. Its all accounted for in the *general* theory of replicators. Its just a matter of how the final numbers comes out in a detailed analysis. (see below)

>

> supercilliousness.

I can't agree with this. It would appear that you don't understand the theory. If you did, you could not have possible made the statements you did about not being selfish. Its not possible. Its simple math. (see below)

I agree I can appear rather arrogant, but I do not do this for all issues. Only things I really know about.

>
>> You miss the point. The term is *net* benefit or advantage. You need
>> to look at this *much* more deeply. Its only an illusion that one
>> does things for the benefit of others.
>
> No. Dawkins recanted this. Read BW and MM.

This is nonsense. He didn't.

One must appreciate that Darwin did not know the specific mechanisms of evolution, and Dawkins, did not at first see the *general* bigger, picture of what genes were. The true "global" theory of "life" is not organisms, or genes or menes, its about Replicators. The Replicator is an *abstract* object from which general properties can be deduced about any object that satisfies the axioms of Replicators. The theory of replicators is correct by construction.

>
>> I have explained this quite a few times. Its based on the theory of
>> replicators.
>>
>> Axioms:
>
> [patronising lecture snipped]

If you actually understood those axioms, its a cut and dried case. The axioms lead to some absolute conclusions. *Anything* satisfying those axioms *must* result in its conclusions. All one has to do is to show some particular object satisfies those axioms. Its like mathematical group theory. One you show something satisfies the group axioms, its a done deal.

Look, given sets of Replicators, if any replicator is consistently better at replicating than another, given enough time, those particular Replicators *have* to dominate to the exclusion of all others. For example, a 1% advantage over 1000 generations, is 20,959. So if the

populations of the replicators were initially equal, after 1000 generations, the ratio would be 20,959/1. If a particular replicator, happens to aid another replicator'ss replication, at the net expense of its own, it must, by simple mathematics, be completely overrun by the replicators it has aided. Thus true and absolute "selfishness" can not be sustained in a system of a group of Replicators.

The theory also explains why people don't like to be thought of as selfish. Its abundantly clear that helping others, e.g in a group, is beneficial to the individual members own replication. For example, who has the best chance for avoiding a kick-in on the way home from the pub. A lone walker, or the gang of 5 skinheads.

The obvious issue with being too selfish, is that if you don't reciprocate help, people wont give you help back, such that you cannot replicate as well as those that do cooperate together. Indeed, this is an example of a "handicap". A first order mathematical analysis would indicate that helping others would be detrimental, i.e. that paricular trait is a handicap, when in fact a detailed mathematical analysis can show that net benefits are achieved from that trait. Its the final probability of improved replication that matters.

Fundamentally, we *all* *have* to be selfish at the root level. We are the result of the most successful Replicators, from millions and millions of years of evolution. It can't be any other way. Unfortunately, most can't like this simple fact, so deny it.

Reminds me of when I was in the Army in the late 60s. The colonel asked me (translates to ordered me) to fix a bunch of mobile 1KW linear amps belonging to the U. S. Mediterranean Mapping Mission. They used them on trucks and jeeps but they had about 10 of the non-functional and they were desperate. The units were Collins autotune push-pull linears and had the Collins trademark of motors gears and bicycle chains. This was familiar because I normally worked on 30KW Collins linears.

The colonel, for his part, somehow choked up schematics and a parts list with FSNs. Word got out that I was doing this little job (small posts have an FTL rumor network I think). Suddenly hams on post decended on me for copies of the schematics and parts list. I had no idea how many hams there were on post. I'm sure it was about 5% of the total military personnel. I wonder still how many of them built the amplifiers (sans autotune).

This discussion happens all the time on comp.dsp, between primarily computer-science folks approaching DSP and EE types approaching it.

EE folks' definition of "linear" implicitly includes time invariance; DSP people have to see it stated explicitly (as "LTI": Linear Time Invariant) lest they think "linear" just means having no second-or-higher-order terms.

It is not a deficiency on either party's part, just a difference of definition in each's respective discipline (is that enough alliteration?).

Therefore, I advise each to bend this much: Use the full phrase "Linear Time-Invariant" when this miscommunication is suspected, so both know what the hell the other is talking about. Now go and sin no more.

Dose not compute. It make no rational sense at all.

>However, I'd agree that his departure from the original
> work was perhaps more subtle than you and most other mortals would
> appreciate.

Must have been. However, as I said minor changes in position are not
important, one cant get all the details right first time.

I remember when I did not understand the details well enough to apply
the theory to picking up women. A naive approach would be to do things
for the women's direct interest, i.e. maybe the women could survive
better, and pass on her genes better that way, i.e acting on the
assumption that a women would chose if you were "nice" to her. Boy was I
wrong. A women will do what ever maximises the number of her genes. This
results in one main fact. She chooses a mate, essentially, only on the
basis of good gene stock. She doesn't want a nice person because this
would mean her offspring would also be nice, and thereby do things not
in there own best interest. She wants a "mean" offspring. That is, treat
them mean, keeps them keen The theories great. It explains quite nicely
why women chose those yobbys that beat them up.

> Well I can only conclude that you didn't understand it properly.

No, you conclude wrong. There was nothing, or little really new. So, "The Blind Watchmaker" by its very title tells you that it is explaining the details of how apparently consciously designed intricate objects, are not designed, but just a result of random process. This is a trivial deduction to the theory of replicators. In addition, it is well recognised that it was the selfish gene book that really made the shit hit the fan.

I genuinely got bored with the book.

> The
> reviews of the book from the world's finest scientific minds testify
> to the monumental significance of this tome.

I don't agree. Reviews mean f'all. Have you actually read all the "review" on the later editions of Hawking's "Brief history of time". It make you want to vomit. Sure, his a very clever dude, but he is ceratyinly not a god.

As noted above, it was the selfish gene that revolutionised the approach to evolution as to the body being a mere vehicle for the masters, the genes and memes.

And you would be wrong.

>Certainly it the concept doesn't readily 'fall out' of
> Darwin's theory.

Not relevant. Dawins theory has been completely superseded by a more general view, where it all just drops out in the wash. After the fact, it was the wrong way to approach the problem. Its unfortunate that many have not realised this.

For example:

All of the content of Einstein's first and major paper on the theory of special relativity "The Electrodynamics of Moving bodies" was already known. It is why the fundamental equations are called the "Lorentz Equations". The issue here was that they were derived based on an intricate detailed knowledge of the *specifics* of EM theory. What

Einstein was the first to show was that all the details could be thrown
away as being just a trivial *conclusion* from the basic concepts he
identified. That is, all of physics is independent of uniform motion,
and his new axiom, the speed of light is an invariant. No one today
approaches SR from direction of its original discovery. Its simple
irrelevant.

The whole emphases on Darwin is wrong, it is a legacy theory. The
fundamental idea is the Replicator, as such, a "handicap" is just a
specific detail of how some particular Replicators can replicate better.

>

Nonsense. It was just something that I could not be bothered to debate.
I have little interest in economics, other than how much I get paid,
which concerns me greatly.

>You're always opening

If your claiming that Dawkins retracted the basics of Replicators, then
your dreaming. I'll have to see what Miller is specifically addressing.

I have read a few bits and bobs from creationists who claim that Dawkins
recanted on his evolutionary views. It was all crap, as he himself
explained.

> [another patronising lecture snipped]
>

Well, obviously, you could not refute my argument that selfishness is inherent. As I said, its a tautology. It can't be contradicted.

Do genes and memes replicate traits? Are traits continually being generated? Are traits selected from? End of story.

I picked up a Motorola high stability oscillator at a local Hamfest. However I don't have any info on the unit to power it up and test it. The model number is K1052A ASPO6, S/N 401033.

All that's on it are three feed through in one corner of the case, marked "E1", "E2", and "E3". Then there are two screw adjustments on the side marked "fine" and "course".

Any ideas?

This is a USED 20 meter three element full size monoband 20 meter beam:

Boom Length - 16.5 feet
Longest Element - 37 feet
Weight - 35 pounds
Wind Surface - 5.4 square feet
Turning Radius - 20 feet
Gain - 8.5 dB
FTB - 29-25 dB

The bean was installed on a tower for several years. I took it down to install a tri-bander.

It was carefully taken down with a bucket truck, disassembled and packaged in the original box; with all the hardware necessary to reassemble the beam. It is in excellent physical and electrical condition. The original assembly manual is included. However, the elements are tarnished (i.e. not shiny) due to exposure to the weather.

The box is 7 feet long by 6 inches by 5 inches and weighs about 45 pounds.

$175.00 plus shipping from 08809.

Hi Folks,
I was asked a question today that I can't answer ;-(

On beacons identifying with FSK or AFSK. Is it the keying that is 'on frequency' or is it the carrier radiated between keying, or is it between the two, where both tones are at the same pitch?.

I've never had to even think about it before.

atb Mike

Regardless of the type of modulation, the "frequency" of a transmission is
the carrier frequency. That is, the frequency of the unmodulated carrier.
Cheers!

Commercial TV and radio receivers are notoriously susceptible to strong signals well outside of their frequency range. The manufacturers have taken too many shortcuts to provide decent selectivity. So the FCC doesn't pay much attention to those complaints.

But as soon as the hams in the area had a problem, they should have been notifying the FCC. At that point, your neighbor was interfering with a licensed service and they do pay attention to that. Admitedly, their attention has been sporadic in the past, but in the last few years they have gotten much more serious about tracking down operators that are causing harmful interference, even if they are licensed. If the event you described happened recently, there may have been a better way. Keep that in mind if he gets back on the air.

No again. Those who are confused about it, and can't admit they are simply wrong about what amounts to a widely accepted definitional matter, simply take refuge by obscuring the basics with a bunch of junk similar to:

"therefore

Vo = 40.Vc.Vi/Re."

The simple fact is you are wrong in thinking you can all of the sudden make up your own definition of linearity, or carry forward without challenge the mistaken definition of others. You were right about one thing: this matter of linearity is pretty basic. You missed it; you are wrong, that is no big deal. The silly part was when you decided to be condescending about it, for in most practical matters strict linearity doesn't matter a lot -- most people know what they are doing well enough such that the accepted definition of linearity is not explicitly referred to.

I don't have time tonight to provide cited work (I have one from Lahti that will be particularly useful for this discussion), since it takes scanning and OCR time and then patch up -- I will do so soon though. In short, you believe "non-linearity" is *required* for modulators; that is incorrect. You confuse the time-invariance property with the linearity property. You believe LTI systems are the *only* linear systems -- they are not according to the widely accepted and published definition of linearity. It is that simple. I gave you an example and worked the solution for you, but still you resist.

You nor anyone else need take my word for it: it is in *all* the Signals, Systems, and Communications texts I've ever opened up -- they are wholly consistant with each other; check for yourself. Your "definition" is not in any of them (af(t) = f(at)???). So I feel justified in simply saying you are flatly wrong. If you could at least post a citation from a text that has your definition and a worked mathematical problem/solution (no "Circuits" junk), then at least we

could say it was all a grand misunderstanding.

> I must confess here I made a small error.

What wasn't small is your reaction to your "small error." All that "pretentious drivel" wasn't so pretentious given the fact it is *basic stuff* that most who've taken the appropriate classes already know (it was a couple definitions and an application using a couple simple trig identities and no more really). That is, the basics which put down your little rebellion against a well established definition.

> {pretentious drivel sniped}

Interesting thought since a Signals and Systems course, or a Linear
Systems course, or a Communications course is often required to get an
EE degree. After all, these courses explicitly distinguish the linearity
property and the time-invariance property. And I've never seen the
"af(t) = f(at)" so-called "definition" until a few days ago.

I've met folks before who think that linearity means freqs cumzoutas
must only equal freqs gozintas. But they don't usually put up such a
fuss when actually presented with the widely available and consistant
literature or reasonable arguments. This is more about fuss than
facts. Now that is consistant with the usenet.

Eric,

The really efficient dsp / digital algorithms come about with
time-varying processes. Another good bit of science is the use of
recursive filters to produce a finite impulse response ... That's one
nice way to squeeze a lot of functionality in a medium-sized IC / FPGA
/ ASIC ... or whatever.

Radio receiver (demodulation) and bandpass algorithm / code get a lot
smaller.

Does the above pose a question, or is it mere rhetoric? Could the
scientific method be applied with gusto? Are Win and Kev evenly
matched? The surname of this forum is *design*. I, for one, would
prefer to see this hypothesis tested by deeds rather than by words. On
this forum, I don't care if its spelled analogue or analog - just make
it work and explain why. IMO, no one here needs to prove anything;
however, it would certaily be interesting to watch such a *contest* if
it were all in good fun and sport.

Very good idea, Roy. You can also build a little more into it,
sacrificing some simplicity. For example, a comparator can
be used to energize a second relay whose closed point is in
the coil circuit for the first relay, or the coil of the
relay can be fed from a voltage divider using only 1 relay,
or any other variation one cares to cobble together to create
the precision needed. The key is to have all current paths
opened by the relay dropping out.

Look, you picking up on a triviality that was thrown in as a side line
and as as immediate response to a justification of my claims. My claims
stand as correct. I clearly stated what was I consider an appropriate
definition of linearity, i.e. no frequencies present in the output, not
present at the input.

> Elementary Sesame-Street Theory (one of these things is not like the
> other) clearly shows this "definition" of linearity to be rubbish.

This was, to all intents and purposes, a typo. I was meaning to refer to
a simple constant gain transfer function. Is it really credible, given
that you are obviously aware of my GR papers, that I am to stupid to
know standard definition of linearity.

However, it would seem that you are another one of those sad people who
think

y=x^2

is a linear equation between x and y.

>
> gwhite most certainly has it correct. KA does not.

Dream on. This is bloody absurd.

www.google.com "nonlinear differential equations" 22,000 hits.

You need to get to grips with than fact that the term "linear" is being
used with two different meanings, where *both* meanings are perfectly
valid in their own contexts. Look, I know what gwite white means, its
trivial. It is also trivial to understand that it is not applicable to
analogue design of amplifies.

Next you'll be declaring that "homogeneous" only, means the one specific
definition as used in differential equations. Or how about "canonical"

> loved this one:

No this one is about gwhite being a pretentious prat trying to impress
everyone with a fancy mathematical definition of linearity that has

little or zero relevance in this context, i.e analogue design of amplifiers. He has *yet* to show how said class A amplifier, as he claimed, can form a modulator without relying on the fact that the transfer function of the transistor is non-linear. He has simple attempted to obscure the issues by making irrelevant technical points.

>

Oh dear..oh dear...You claimed that the class A amp was a modulator an
achieved this modulation by way of linear means, you fail to present
your proof of this claim, and then spout of with mathematical waffle,
and claim that I am being obscure?

I clearly showed how the class A amp achieved modulation based on the
non-linear relation of emitter current verses base emitter voltage. The
fact that you have failed to give an alternative mathematically proof
indicates quite clearly that you pissing in the wind.

Present you argument of exactly how your claim is correct, or retract
you claim.

>
> The simple fact is you are wrong in thinking you can all of the sudden

Absolute crap. Show me one respectable math reference that says if
y=exp(x), that y is a linear function of x.

You were right about one
> thing: this matter of linearity is pretty basic.

Indeed it is.

> You missed it; you
> are wrong, that is no big deal.

Indeed its not. My SuperSpice works quite nicely based on the well known
theory of the solution of non-linear differential equations.

Show me one real practical example that does not use a device with a
functional relation between input and output voltage/current that is
linear, as I defined above. As did note as an after thought, it may be
possible in principle, for example, maybe one could construct a true,
linear with voltage, voltage controlled resistor. However, I am not
aware of such magic devices.

The physical reality is that it is not possible. Produce one and I will
retract my claim.

> that is incorrect. You confuse the time-invariance property with the
> linearity property. You believe LTI systems are the *only* linear
> systems -- they are not according to the widely accepted and published
> definition of linearity.

No. Linearity is widely understood to have many definitions. I have
explained some of these already.

> It is that simple.

Nope. Its not. Linearity has many definitions. In the context of
analogue design, linearity is defined based on where the is a non
straight line between input and output. The whole subject of non-linear
differential equations in spice is based on this concept.

> I gave you an example
> and worked the solution for you, but still you resist.

Look, I have no problem with your example of a particular definition of linearity. I already explained how such an example is meaningless in analogue design by giving an example.

A mathematical definition only has meaning if it is useful when it is applied. In analogue design this definition is useless, so it is not used.

>
> You nor anyone else need take my word for it: it is in *all* the
> Signals, Systems, and Communications texts I've ever opened up -- they
> are wholly consistant with each other; check for yourself.

I don't care a toss about and communication texts. I care about linearity as understood in the solution of the non-linear differential equations used in Spice. I suggest that you read some of the many papers on the solution of such equations.

Look, I don't claim that the particular definition of linearity that you presence is "wrong" in principle. It is a very well known definition. However, it is one of many, and is simple not applicable in this context.

Your
> "definition" is not in any of them (af(t) = f(at)???).

I did not say that this was a definition. This was just thrown in as side line, and I said as much. This was, to all intents and purposes, a typo. I was meaning to refer to a simple constant gain transfer function. I clearly said that linearity, as defined in analogue design, is essentially defined by the absence of any frequencies in the output not present in the input.

> So I feel
> justified in simply saying you are flatly wrong.

No. You is you. You have singularly failed to show how your class a amp is a modulator without using a non-linear relation between input voltage/current to output voltage/current. If you claim that y=exp(x) is a linear relation between x an y, further debate is pointless. You don't the first thing about math.

If you could at
> least post a citation from a text that has your definition and a
> worked mathematical problem/solution (no "Circuits" junk), then at
> least we could say it was all a grand misunderstanding.
>

www.google.com "nonlinear equations"

www.google.com "nonlinear differential equations" 22,000 hits.

You problem is that you are trying to argue a different point and simple don't see it. You were off on a roll trying to impress people which mathematical technicalities that are simple irrelevant in the context of

this original discussion. In short, you are a smart arse.

>
>> I must confess here I made a small error.
>
> What wasn't small is your reaction to your "small error." All that
> "pretentious drivel" wasn't so pretentious given the fact it is *basic
> stuff* that most who've taken the appropriate classes already know

I know all about your definition. I dont disagree that it is a valid definition in some contexts. However, it is not applicable to electronic circuit design that is based on the solution of non-linear differential equations, with the "non-linear" term having a universally accepted meaning by the 10,000s of mathematician who actually study such equations.

>(it
> was a couple definitions and an application using a couple simple trig
> identities and no more really).

So basic that you can stand there and declare that:

Y=x^2

is a linear equation. Yeah...LOL. get real.

The meat:

You arnt wrong in this thread because of you particular claim of linearity. You are wrong because the fundamental claim that you made was that your class A amp was a modulator that did not rely on the non-linear transfer function of the emitter current verses Vbe. You have absolutely failed to explain any exact *details* to support your claim. That is, show me a specific analysis of the amplifier, without the irrelevant mathematical waffle, that shows that:

Vo = V(t)(1+ a.sin(wt))

I will accept the argument that you simply misunderstood my, very common definition of linearity, i.e. y=x^2 is a non-linear equation relation x to y in *any* mathematical book you care to name, with a linearity definition more appropriate to general systems analysis.

In closing:

The real reason for this disagreement is that you are talking apples and I am talking fish net stockings. You are applying the term linearity in a completely different sense than the one I am using. Both are valid in principle, and are indeed well accepted, under their appropriate conditions. The issue however, is that I have made an effort to actually explain in other posts, what the distinction is, but you are simple too closed minded or too stupid to understand. In this particular case, modulation is, in practise, universally achieved by a non-linear transfer function. That is y=f(x) is non-linear as defined in any math

text book you care to name. Its simple not debatable. However, applying signals to such a transfer function, can result in the condition, that given that a certain output is required, non-linearly related to the input in the strict sense, this output is linearly related to the input signals. That is, if a certain input gives an output, the sum of two inputs, give the same output as the individual output sums. In this sense it may be said to be linear. That is the wanted summed output is the wanted output of the individual inputs. In one case the term linearity is being applied to the fact that the output is not a direct linear function of the input, in the other case, the term linearity is being applied to the fact the wanted output is is a linear function of the input sums. That is, in one case, the term linearity is being applied to the specifics of a system part, where as in the second case linearity is being applied to a system wide property. What seems to defies rational belief, is that you seem totally oblivious to the fact that the term linearity is being applied to two completely different aspects of a system, and cant be directly compared as to which one is more valid then another.

Your a liar. Its that simple. I clearly stated that it was *not* a definition. It was simply trying to illustrate the concept of constant gain. You expanding on some trivial minor point to avoid answering the main issue, to wit, you have failed to disprove my claim on your class A amplifier.

Absolute crap. The notion that y=x^2 is a non-linear equation is universally accepted by anyone who has done even the slightest bit of theory on basic algebraic equations. It does not require any qualification in the slightest.

Now go and sin

Indeed. So why *are* you putting up such a fuss about notions that are
widely held in the literature. Show me one, and I mean just one, that
declares y=x^2 a linear equation.

The more I look at this, the more I realise that I am over the heads of you guys. I am making standard assumptions, and because some individuals are simple not conversant with common knowledge in the field, make what are, basically Jesus wept statements.

For starters, there is obviously confusion here on sufficiency and necessesity. If a function satisfies a(f(x)) = f(ax) is it guaranteed to be linear? Now, we are discussing practical modulators/amplifiers. Do we care about dc offsets? For those knowledgeable in the field, do we usually need to actually specify that dc offsets are being ignored in normal explanations? for instance, do we usually use a capacitor to eliminate them?

I must apologise for this. I need to be more aware that many are not aware of common assumptions, that are taken as read, by those individuals, who, for example, have been doing analogue design, for example, for 20+ years.

Frank

I got mine from Kanga U.S., but I see Kanga U.K isn't selling anything, and they only list one book. I also suspected G-QRP as a source, but they don't show it on their web site. If there is a U.K. Source, George Dobbs, G3RJV, would know. In fact, I think I saw it at George's booth at Dayton. Bill Kelsey at Kanga U.S. is a nice guy and easy to deal with (http://www.bright.net/~kanga/kanga) but I suspect there is a UK source somewhere which could be a lot easier for you.

The book is $20 U.S. so it's probably going to be 20 pounds by the time you get it across the pond.

Paul Harden does this wonderful artwork which makes the book a real joy. It's such a dense collection of reference info that it really is a "must have" for a builder. It may be a little more U.S. centric than you would like. Although he does show drill sizes for various metric screws, his transistor table pretty much sticks to the 2N and 2SC types. Still, it's almost worth it for the wonderful capacitor section. And he does show all the common toroid mixes, how to wind toroids, and he has some nice charts of inductance and Q for the more common mixes.

"Linearity can more easily be expressed as: a(f(t)) = f(at)" -- Kevin
Aylward

I think someone is posting under your name. A nasty bit of business
that is.

> It was simply trying to illustrate the concept of constant
> gain. You expanding on some trivial minor point to avoid answering the
> main issue, to wit, you have failed to disprove my claim on your class A
> amplifier.

Class A works just fine in multipliers/modulators -- "non-linearity" of
circuit elements is not required. Maybe you can analyze the old
MC1496. That would be enlightening to you. But more important and more
simple (it will save you loads of time), just apply *the* linearity test
for

h(t)
x(t) -> y(t).

> The notion that y=x^2 is a non-linear equation is
> universally accepted by anyone who has done even the slightest bit of

> theory on basic algebraic equations. It does not require any

No shit, by why are you rambling on and on about it?

>Show me one, and I mean just one, that
> declares y=x^2 a linear equation.

That is clever -- you want me to "declare" something is true that I've made no reference to. You are quite the inventor. Face it: you had an incorrect notion about linearity. All the rest of your words are twisting, squirming, and turning to try to save face after you acted condescending (and still do) about a very simple matter. That's all.

1790. Re: Measuring small inductances using a return loss bridge

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-08 19:00:48 UTC
From: k7itm@aol.com
Message-ID: <3200347.0309081100.7bcdb3dc@posting.google.com>
Source record: 32658

I saw the subject line, and was ready to warn against trusting a
return loss bridge at high reflection coefficients (assuming you'd
just hooked the L directly across the RL bridge unknown terminals),
but of course the method of putting an R and C in series gets around
that problem. If you have a swept system, you don't have to tweak the
cap, just look at the freq where the return loss is minimum...or where
the phase changes the fastest, or is zero. Then perhaps you don't
even need the series R (see next paragraph...).

In the "Measurements and Analysis" chapter of Reference Data for
Engineers, there are several bridge circuits suitable for measuring
inductance. One is a "resonance bridge" which really is doing just
what Richard wrote about. One arm of the bridge is a series RLC. But
in that case, the R is the equivalent series resistance of the LC, and
is balanced by the other bridge arms at resonance, just as a simple
Wheatstone bridge. Note that if your return loss bridge has been
calibrated to be accurate at small resistances, you can use this
without the series R in your LC to get a very quick estimate of Q, but
you can also do that by sweeping the frequency. -- See also circuits
for HP and Boonton (and GR?) Q meters.

Cheers,
Tom

It doesn't have "many definitions" when it comes to the EE profession.
The one definition is wholly consistant across academic texts -- without
known contradiction. Everyone who took courses like Circuits, Fields
and Waves, and on and on, also took a Signals and Systems (or similar
under a different name) course. That some, such as you for example,
didn't learn or understand the definition is notwithstanding.

> Look, I have no problem with your example of a particular definition of

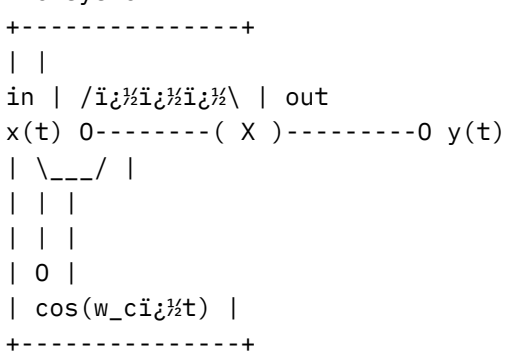
> used.

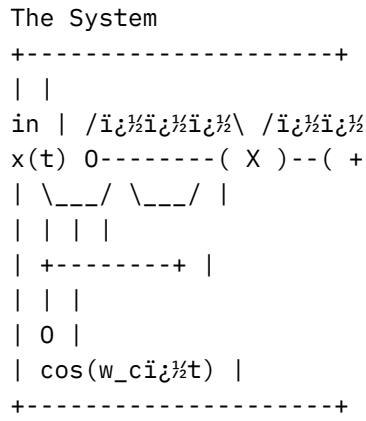
It is useful to the extent modulation is a linear operation produced by
devices such as gilbert cells biased to Class-A. It is very useful
definition: for example, high data rate modern digital communications
systems routinely utilize linear modulation/demodulation.

It doesn't even matter if the upper transistors in the gilbert cells are
driven to the switch mode (switch mode is not a requirement; class-A
will do) by the LO. It is still linear modulation.

This system is linear:



This one is not:



Do you know why?

Hint: it has nothing to do with any "exp(x)" or other solid state
issues.

> > You nor anyone else need take my word for it: it is in *all* the

> not present in the input.

That "definition" is incorrect, as has been pointed out already.

> You were off on a roll trying to impress people which
> mathematical technicalities that are simple irrelevant
> in the context of this original discussion.

Right. I was trying to "impress" by using a couple of trig identities.
LOL

> I know all about your definition. I dont disagree that it is a valid
> definition in some contexts.

It is the definition for the EE context. If you want an LTI system,
then so be it.

> However, it is not applicable to electronic
> circuit design that is based on the solution of non-linear differential
> equations, with the "non-linear" term having a universally accepted
> meaning by the 10,000s of mathematician who actually study such
> equations.

It is not a matter of a mathematician's characterization of equations.
It is the EE characterization, and this is largely an EE forum. If you
are a mathematician and not an EE, then I can see why you would believe
what you do.

> You arnt wrong in this thread because of you particular claim of
> linearity.

It isn't "my claim." It is the standard definition for EE's. That some
EE's didn't quite "get it" is notwithstanding.

> The real reason for this disagreement is that you are talking apples and
> I am talking fish net stockings. You are applying the term linearity in
> a completely different sense than the one I am using. Both are valid in

> conditions.

Your definition is not the EE definition.

> That is y=f(x) is non-linear as defined in any math
> text book you care to name.

This is a matter of EE definition. Recall how you sniped about the EE
courses I apparently didn't take "with all due respect."

"A linear system, cannot produce frequencies that are not in the input,
essentially, by definition. With all due respect, I would guess you
don't have an EE B.S. degree. This is all pretty basic stuff really."
-- Kevin Aylward

So you originally sniped about my education in electrical engineering,
and then ignore those very same basics taught in all EE curriculums, and
then turn course and take refuge in a math text. Okay, Kevin, have it
your way.

I'm not suggesting he held *this* particular loony idea. The example
from Tressel was only that; an example.

>>> No he didn't. Of course, people tighten up or refine their original

>Must have been. However, as I said minor changes in position are not

Indeed. Hence the re-think between the books. They were what? 10 years
apart? People move on and refine their ideas. You should read
Wittgenstein to see how far a man can change his outlook over the
course of his life!

>I remember when I did not understand the details well enough to apply

>why women chose those yobbys that beat them up.

Can't agree there. Women are basically genetically obliged to pick the best mate they can get their hands on, given the limitations imposed by their own pulling abilities. What they are looking for in every case is a mate who can give their offspring the best chance of survival and 'thrival' in this wide, mean world. Interestingly enough, the qualities the male must display to succeed change according to different ages (historical ages, not biological) and cultures. At varying times, men have been favoured because of, for example, they're exceptionally good fighters. Or unusually good hunters... later in history, we see female preferences based on wealth and status. But in countries where for idealogical reasons, all people are 'made to be equal' like the old Soviet Union or the 'old' China, females must pick according to other criteria such as a gift for literature, music or art. They're all programmed to do their best for the unborn child, even if they don't want children at all or are too old to conceive.

>which concerns me greatly.

LOL! Yeah, whatever. You quit while you were behind. You should have
quit earlier but I think you just about backed out before you
sustained any terminal damage. :-)

>If your claiming that Dawkins retracted the basics of Replicators, then
>your dreaming. I'll have to see what Miller is specifically addressing.

I'm suggesting no such thing. I'm simply saying that Dawkins softened
his line of selfishness a good measure from the position you wrongly
(now) attribute to him.

>I have read a few bits and bobs from creationists who claim that Dawkins
>recanted on his evolutionary views. It was all crap, as he himself
>explained.

Yes I know. The attempts were laughable.

>Well, obviously, you could not refute my argument that selfishness is
>inherent. As I said, its a tautology. It can't be contradicted.

Okay, well let's put you this question: if everyone is basically
selfish, why do some people help other people out on newsgroups?
I think I know what your answer will be but I want to see it from you
yourself in black and white. And don't be afraid this time, Kev.
Evolution's not my specialist area. :-)

[snip]
Hmmm .... you may be mistaking the (sometimes linear) current steering
effect for the mechanism within the transistor that makes current
steering possible: the relationship between gm and Ic ... or from
another POV, the change in rbb with respect to bias current. These
effects are non-linear.

Anyway, with all this talk of AM modulators I recall some papers I
read back in the early 1980's on vector modulation ... or the use of
the sum of two phase-modulated signals at high power, with a
compensating signal at low power such that the sum yielded a perfect
amplitude modulated wave ... very little power required from the
actual linear "AM" section. The technique is used to generate an AM
signal of many kilowatts, whilst using only a few hundred watts in the
required linear [c(t)] stage.

If the audio signal is expressed as a(t), and the phase-modulated
signal is limited to a p-p deviation of slightly less than pi/2, and
the compensation signal is c(t), then the crude diagram is as follows:

```
______
PM(-a(t)) -----| \ ______
| T1 0--------| \
PM (a(t)) -----|_____/ | T2 0----- "AM" out
c(t)--|_____/
```

T1, T2 = 90-degree hybrids

IIRC, many AM broadcast transmitters now employ this technique.
Hopefully, someone out there has a better recollection than I and can
provide a reference.

I have to say I've been wrestling with this attitude problem of kev's
as well. Earlier this evening I postulated to myself that the reason
for all these contradictory posts and arguments over semantics might
possibly be due to Kev's impared usage of English. If the guy's
dyslexic or has some other comprehension problem, he might very well
be an electronics genius but we'd find it hard to tell because this
veil between he and us muddies the water both ways. You view as
expressed above is a very much more cynical one, but I'm forming the
view that one or t'other must explain it. But Kev has admitted to
English not being his strong suit elsewhere on the group and if that's
the case and he really *does* know what he's talking about then I feel
sorry for him. It must be pretty shitty and exceedingly frustrating
for anyone in that position. I know; I've met a few and it's ruined
their lives.

What *is* "current steering"? Does it for example refer to direction
or level or both? And what does the steering?

herewith a self-confessed doesnt-know-it-all's analysis:
IF
y(x) = mx+c (even KA cant argue with the linearity (and time-invariance) of
this....LOL)
THEN
y(ax) = max+c
AND
ay(x) = max+ac
Elementary Sesame-Street Theory (one of these things is not like the other)
clearly shows this "definition" of linearity to be rubbish.

gwhite most certainly has it correct. KA does not.

as a slight aside, I have read H&H about 8 times, and will continue to do
so - it is one of the more useful books on electronics I have ever bought
(and I have about 600 of them). If you do not have that book - GO AND BUY
IT!! I even met WINFIELD Hill at an MIT junkfest once a few years ago, and
had an interesting discussion with him about my work on high-speed PMSM
energy storage flywheels and giant SMPS. That guy is really smart - I
suggest anyone reading this forum should pay close attention to win's
postings (i sure do). As far as being an "academic" - well, go read H&H -
its beauty lies in its practicality, unlike most texts. Just because someone
works in academia, doesnt mean they are useless (although to be fair, its
usually not a bad first guess). Likewise I have met plenty of blithering
idiots out doing "real" engineering (its a good thing - competent people end

up being well paid to fix their screw-ups). The worst ones tend to work in sales (I presume its because they cant get real jobs)

Really this entire thread has done little more than allow Kevin Aylward to appear like a pompous idiot, with a somewhat limited understanding. A BSc and half-a-dozen MSc courses (one A - wow. I remember those - they are what you get if you dont do well enough for an A+) simply makes for a failed MSc. Of all the pomposities, I just loved this one:

>> In all honesty, there is not much I don't know about general analogue
>> design, although, obviously, I don't claim to know it all.

It kind of makes one wonder just how KA knows there isnt much he doesnt know.

why do I post on these newsboards? am I being selfish? I dont think so. I have had questions answered for me, so it is only fair that I answer those that i can (quid pro quo). I also get a bit of a buzz when i can "show off". And reading posts from others can be very informative. Some stuff is downright hilarious (thanx KA). I could "listen" to Jim Thompson & Win reminisce for hours - riveting stuff.

GeryD.,
I read your posting with interest and sympathy. I have to same damn problem here. I too am looking for a way to zap the stereo. Sometimes they just have FM radio cranked up. I was thinking an FM broadcast band xmitter with a beam and some extra help from a "brick" amp would be a good thing. Find approiate music (music they hate) and broadcast it their way. Just a thought. If you could figure out a way to zap their noise in the microwave range that would really be cool. Good luck and I will check for further postings, as the "law" has laws on the books they won't enforce, and it's getting to be a joke (the law(s)

hello,
I would like to use my computer for logging as I work DX stations, would like to try PSK31, etc. BUT.... the computer wipes out half the HF bands. I waited until the hard drive went into sleep mode and the RFI was much better. I tried grounding the computer case to an earth ground but to no avail. Anyone else have this problem and how did you remedy it. My box is not super fast, being a mere Intel PIII 450 mhz proc. It has the usual things, vid card, external modem, and sound card. Your help appreciated.

The monitor, even LCD, is a significant source of RF noise.

Also worth checking the cabling, and upgrading to shielded cable if
you don't have now.

Use one source of grounding for the system.

Happy trails,
Gary (net.yogi.bear)

Does the RFI appear only when the disk is being accessed, or is it
present at all times when the disk is spinning?

If the former, you might be able to snub out some of the interference
by installing ferrites on the data cables from the drive to the
motherboard. You can get clamp-on flat ferrites for ribbon cables, or
clamp-on split-ring ferrites for the newer-style round "high airflow"
cables. Install ferrites as close as possible to the drive, and also
at the motherboard end of the cable.

If the interference is present whenever the drive is spinning (and not
just when't being accessed) then the RFI may be coming from the
drive's onboard CPU and DSP. Damping down this RFI within the cabinet
is likely to be tricky to do, as adding a shielding/damping material
(e.g. a ferrite sheet) to the drive controller PC board might cause
drive overheating, or might short out something on the board.

You could try clamping ferrites on _all_ cables leaving the case...
monitor, keyboard, mouse, etc. It's possible that EMI from the drive
is being conducted out on these cables.

You may need a better-shielded case. I've seen a lot of cases on the
market which don't appear to have good shielding properties... the
sides are plastic (often without an anti-conductive coating of any
sort), there are no (or ineffective) contact flanges to tie the sides
to the case, etc. My hunch is that a lot of PCs built with this sort
of casework (by e.g. smaller, neighborhood or regional PC-builder
shops rather than national manufacturers) probably don't meet FCC
Class B EMI radiation/conduction limits.

The cases I've seen sold under the Antec brand name seem to be pretty
good ones - solid metal sides, metal shielding for any unused
chassis-front drive bay, good contact flanges between surfaces, etc.

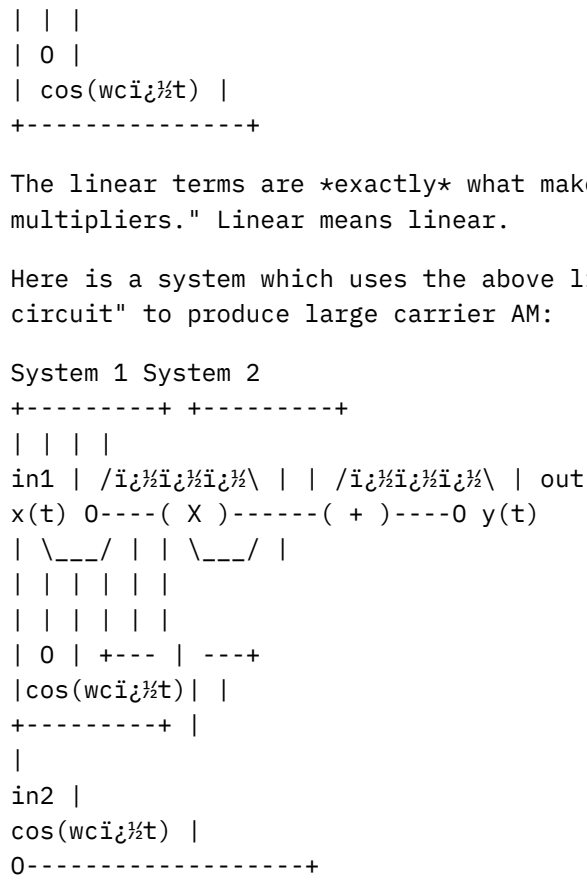
Non-linearity is *not* required to create DSB-AM out of transconductance type multipliers like the gilbert cell. In fact, *non-linearity is specifically something that designers hope to minimize* -- just like in any linear device. The standard linear approximation practice ensues: that is, the taylor expansion of exp(x) is done and the linear term is the desired one and *it is all that is required or wanted for this linear multiplier*. The rest of the terms are unwanted and that includes the multipliers usage as a frequency translator, which I proved to be a fundamentally linear operation. No one needs to take my word for it. Anyone interested can idealize the gilbert cell to only the linear terms and the device will still be able to produce DSB-AM -- IOW, non-linearity is *not* required.

The *linear terms* on both the inputs of a class-A biased gilbert cell are exactly what are anticipated in the higher level system drawing, the non-linear terms are *not required* for DSB-AM to occur (to the extent higher order products exist they are unwanted products). Driving the LO port into the switch mode is notwithstanding. For example:

The System
+----------------+
| |
in | /ï¿½ï¿½ï¿½\ | out
x(t) O--------(X)---------O y(t)
| ___/ |
| | |



The linear terms are *exactly* what make the gilbert cells "linear multipliers." Linear means linear.

Here is a system which uses the above linear system, and another "linear circuit" to produce large carrier AM:

That these two systems can be (and have been) made with "linear" circuits is indisputable. The output is indistiguishable from large carrier AM so we can just as well call it that.

Now it is interesting that as far as the x(t) -> y(t) concern _alone_ goes, this "total" system is _not_ linear (apply the linearity test to see how/why). But that has absolutely nothing to do with any circuit issues like exp(x) and does has everything to do with the definition of linearity as it is taught in the EE curriculum. No "non-linear" circuit element was required to result in a non-linear system with regard to the x(t) -> y(t) transfer. The "non-linearity" is the sole consequence of the fact that this "total system" is a Multiple-Input-Single-Output (MISO) system. It is interesting that System 2 is the MISO system. With regard to either of the inputs, and its respective output, the response of System 2 is linear -- identical in manner to the simple op-amp summer. But with regard to the total output of System 2, when neither of inputs are zero, the system is non-linear _with respect to a single input_ by the EE definition. That ought to make KA's blood boil: a "linear" circuit reduced to non-linearity by definition.

In Summary:
Non-linearity in terms of circuit elements is not required to "make AM." The concept of linearity in the EE curriculum is consistant across courses. That includes Signals and Systems, Circuits, and Electronic Design. That some are not up to speed on the linearity property is

notwithstanding.

> provide a reference.

You might hinking of the Chirex Outphasor, or a similar idea (I don't know how c(t) fits into the Chirex). Yes, it can be used to make an AM signal. The thing is it *is* a non-linear method and you aren't calling out the amplitude to phase mapping that is required for your +/- a(t) signal.

I don't dispute at all that he knows a lot about EE. Rather, I would say he does know quite a lot. But no one knows it all and all people make mistakes here and there. As best I can tell, and for what I learned (and I worked pretty hard at it), he looks to be flat wrong on this detail (and a detail is about all it is).

The good news is that a misunderstanding of what linearity *strictly* means will not likely prevent an otherwise competant engineer from building a very effective AM or AM/PM system.

Look, you don't even realise that you are using "linear" here in a
completely different sense then one applies it to an equation.

What part of "I agree, that a modulator can be described as a linear
process" do you have trouble with.?

What part of "A modulater usually achives its function by using a
non-linear relation between input voltge/current to output
voltage/current do you have trouble with.?

In one case "linear" is being applied as a property of system as a
whole, in the other it is being applied as a property to an individual
component of system.

Both statements are correct, in their given contest, but they are saying
"different" things.

The issue here is that you have parrot read something from a book, and
then go applying willy nilly it without even the slightest idea of when
it is applicable. Non of the standard references suggest that non-linear
equations are linear. This is daft. There are addressing a different
matter entirely. I have already explained what the distinction is, you
have failed to understand, the point, and I doubt never will.

It is very useful
> definition: for example, high data rate modern digital communications
> systems routinely utilize linear modulation/demodulation.

Of course its useful, assuming you are competent enough to know when it
can be applied.

>
> It doesn't even matter if the upper transistors in the gilbert cells
> are driven to the switch mode (switch mode is not a requirement;
> class-A will do) by the LO. It is still linear modulation.

I don't disagree, never claimed otherwise. This is a diffent use of the
word linear. However, it achieves its "linear" modulation by non-linear
means, which you claim it doesn't.

>
> This system is linear:

{sniped teaching granny to suck eggs drivial}

>Do you know why?

Yes. I already explained it. You snipped it in my last post.

Jesus wept dude. This is bloody ridiculous. Look sonny boy, snipping my
detailed explanation of why your modulator can be classed as a linear
system, in the given context, shows you for the liar that you are. You
don't impress anyone by attempting to prove a result, you have been
informed at least twice that, is trivial, and that I had already agreed
with that result, in that particular context.

>
>> I care about
>> linearity as understood in the solution of the non-linear
>> differential equations used in Spice.
>
> Like I said early on: you can make the answer come out however you
> want if you are permitted to make up the rules and change them as you
> play.

The rules have not been changed. Unfortunately you are too incompetent
to know when to apply the relevant rules.

Show me one Signals, Systems, and Communications text that declares
y=x^2 is a linear equation.

What part of "apples" and "fishnet stockings" did you have trouble with?

>
>> Look, I don't claim that the particular definition of linearity that
>> you presence is "wrong" in principle. It is a very well known
>> definition. However, it is one of many, and is simple not applicable
>> in this context.
>
> It is the definition for the EE profession.

Its apparent you know f'all about definitions in either mathematics or
electronics, nor how to apply them.

>
>> I clearly said that linearity, as defined in analogue design,
>> is essentially defined by the absence of any frequencies in the
>> output not present in the input.
>
> That "definition" is incorrect, as has been pointed out already.

It is not, as has been pointed out to you already. proof:

1 Go to *any* and *all* main component vendors web site, e.g. TI, Analog
Devices, Maxim, LT, National, etc

2 Look at their dat sheets and app notes on A/D D/A converters
3 Note the use of FFT testing for linearity.
4 Note how they *all* declare the linearity of A/D D/A by the level of
spurious frequencies

This is the definitin that is *actually* uesd in the EE profession.
Its the way it is, and no amount of your huffing and puffing will change
what is standard practise. All you have done here is show that you have
not got a clue on what is standard practise in electronic engineer. Your
words mean nothing

The reality is, is that you are simple trying to hide you failure to
show that your class A amplifier cannot achieve modulation without using
the non-linear relation of input voltage to current. Its as plain as
day.

Produce you proof of Vo(t)= Vi(t).(1+a.sin(wt)) or shut the f'ck up.

>
>> I know all about your definition. I dont disagree that it is a valid

> believe what you do.

Sorry mate, what part of "there are 100,000's of EE's out there using Spice, all on the understanding that the equations of electronic design are non-linear" do you fail to undrstand"? Your a right blooody joke.

You particular Mickey mouse, comic book understanding of what constitutes an acceptable definition in EE is irrelevant. We real practicing design engineers don't care about you erroneous waffle. Secondly, there is not a hope in hell that the authors of your quoted references will agree with your gross distortion of their books contents. You have not the slightest ability to apply such knowledge. Your on you own.

>
>> You arnt wrong in this thread because of you particular claim of
>> linearity.
>
> It isn't "my claim."

It is your claim. No competent author will claim y=x^2 is a linear equation. Get real.

> It is the standard definition for EE's.

As I explained above, complete an utter nonsense. You haven't the slightest idea of what is standard practise in electronic engineering. I have been an analogue designer for over 20 years, and no one I have met uses your suggestion in the design of circuits. Your definition is more appropriate to complete system design, then discrete component design.

That
> some EE's didn't quite "get it" is notwithstanding.

Indeed they dont.

You are simple too dense, are are too much of a coward to admit your wrong. I explained in detail the two diffent comcepts of linearity.

>
>> The real reason for this disagreement is that you are talking apples

> by their own pulling abilities.

By and large, this is not significant. The numbers can be increased by quality or quantity. A man will have sex pretty much with *any* women, so long as they're not fat:-). If a women goes up to a man stranger, in a pub and says, lets go back to my place, its a done deal. There is no much of a disadvage numbers wise, a man has offspring by every women he can so he does. On the over hand, a women can not do this. Once she's pregnant, that's her out of the game for 9 months. The only way she can get her genes to replicate faster is by choosing better gene stock. This makes her absolutely choosy.

>What they are looking for in every
> case is a mate who can give their offspring the best chance of
> survival and 'thrival' in this wide, mean world.

I think you have still missed an important point here. Yes, I agree that there is some truth in this, and this is a pretty obvious analysis, but it is not that significant. The most important facter is good gene stock. Its the only factor. She will chose a mate based on what characteristics the offspring will have. Not what's in her personal best interest. The body is only a vehicle for the genes. Bodies don't copy themselves, so cant form a basis for replication, only genes replicate. If it is the net best interest of the genes, they will sacrifice the vehicle to enable better success for themselves.

Interestingly enough,
> the qualities the male must display to succeed change according to

> art. They're all programmed to do their best for the unborn child,
> even if they don't want children at all or are too old to conceive.

But in practice, the single most significant aspect, even today, is
physical appearance. It has to be. Its pretty much universal what is
considered good looking, many studies have been done. Sure, its useful
to have other aspects. A show of wealth, is obviously an indicator that
her offspring may also get this characteristic (ignoring the details of
how for now), but in pracise, you have to be pretty damn weathy if you
want to take Liz Harley to bed.

If you mean that we might be able to override the gene's "intentions", I don't know if what he says is really what he believes, or is an attempt to appease the masses for politically correct reasons.

The problem is, the only way to override a Replicator, is make a better one. Unfortunately, the ones we have, have millions of years of a head start. You try not getting a hard on if naked striper sits on your lap.

> selfish, why do some people help other people out on newsgroups?

I explained this, the 5 team bunch of skinheads verses the single guy, although there is a number of factors. The fundermental reason is that the genes expect a payback. Of course, detrimental characteristics are still being randamly generated, so some of them are fools. Have you been to the dawin awards site http://www.darwinawards.com/ ?

In *general*, is it good or bad to gain a respected reputation?

Genes don't know when helping is going to be beneficial or not, they cant think. They don't know the future. Replication is only based on probabilities. If you help nobody, what's the probability you will get help back? One has to look at the numbers from game theory. Give various traits, e.g helpfulness, punishment, slyness, e.g. tit for tat strategy etc. The final numbers give what strategies are stable, or drive the group to extinction.

So, people are helpful to others because, statistically, this strategy results in net benefit to themselves, statisticly.

Never said it didn't. However, the class A bit does not account for how
they multiply.

>-- "non-linearity"
> of circuit elements is not required.

Ho humm. Now for the example that does indeed use non-linearity.

Maybe you can analyze the old
> MC1496. That would be enlightening to you.

Yep.

Not at all. You are an completly mistaken. It is abundantly clear that
you don't know the first thing about analogue circuit design. It is
truly amazing and unbelievable that you can be so wrong and not be aware
of it. You are an incompetent.

The MC1496 is a double balanced modulator based on the Gilbert cell
transconductance multiplier. The Gilbert cell multiplier relies on the
exponential relation of collector current to base emitter voltage. That

is, its transconcutane is a function of its emitter current. Its well understood by all those knowledgeable in the field. to wit:

I = Io.exp(V/Vt)

transconductance gm = dI/dv = d(Io.exp(V/Vt))/dv

gm = Io/Vt.exp(V/Vt)) = Ie/Vt

That is, the gm is a function of Ie.

Since:

Iout = gm.Vin

we have

Iout = Ie/Vt.Vin

That is, Iout is a product of, Ie and Vin. Making Ie a function of another voltage results in the multiplication of two voltages, i.e. a modulator.

How you can make such daft claims and not be embarrassed shows greate stamina, I must say.

>But more important and

> that is required or wanted for this linear multiplier*.

Ahh... now I see where the confusion is, and I did already address this by my comment on the non availability of real, linear voltage controlled resisters. I stated that in principle, one might be able to find a device that was strictly linear in order to achieve modulation. I also stated that such devices do not appear to exist, such that in practise, one generally has to use a non-linear device to achieve multiplication.

It should go without comment that when one analyses the simple transistor multiplier that one only selects the first order linear term, and that this is term that generates the multiplication. This is trivially obvious, and was what I showed in my original analysis, gm is inherently a small signal property. Indeed, as this is only valid for small signals, more complex multipliers log the input signal so that in conjunction with the exponential relation results in perfect

multiplication at all signal levels, originally due to Gilbert I might add.

This confusion here appears to me to be one of semantics or x-wires, as is often the case on strongly held, but oppositely apposed views. gwhite claims that you don't inherently require a non-linear device to achieve multiplication, I claim that all practical devices have a non-linear transfer function, and it is this transfer function that results in multiplication. I don't believe we are arguing about the same point. I have nothing more to say on this. I have better things to do.

==========
Perhaps you should also suspect the switch mode power supply unit of your PC.
even if it is fully metal enclosed . The 230 or 115 V AC filter might also be sub-standard .
The latter could allow RF type sigs to pollute the power supply system and hence your radio.
This can be checked partly by temporarily running your radio off-grid ,through a 12V battery ,if that is possible.

A light dependant resistor. One input drives a LED via a linearizer
to compensate for LDR non-linearity. The LDR resistance is unaffected
by the voltage across it. Therefore, the resulting current
Io=f(V1,V2)= k.V1*V2 (4-quadrant multiplier or compensated gilbert cell)

The circuit output is *superposition linear* relative to each input.
dIo/dV1=k.V2, dIo/dV2=k.V1 (partial derivatives). In mixer operation,
Io=f(Vin,Vosc). Vosc is an independant time-varying signal.
Therefore, Io=f(Vin,Vosc(t)) or Io(t)=g(Vin,t). Because Io vs Vin
is linear (4-quad multiplier), then dIo/dVin= g'(t) ie: a function
of time only. This is the definition of a linear time-varying
circuit.

>>that is incorrect. You confuse the time-invariance property with the
>>linearity property. You believe LTI systems are the *only* linear
>>systems -- they are not according to the widely accepted and published
>>definition of linearity.
>
> No. Linearity is widely understood to have many definitions. I have
> explained some of these already.

An ideal multiplier is considered nonlinear with respect to a certain
signal if a component of that signal is applied to *both* inputs

simultaneously. Then:

Io=k.(V1+a.V2)(a.V1+V2)= k.(aV1^2 + a.V2^2 + (1+a^2).V1.V2)

>I have nothing more to say on this. I have better things to do.

However, what the hell...:-)

We know for the diode:

gm = 40.Id.

That is, the gm or IV slope is a fuction of I. This allows another
transister to give an output:

Iout = gm.Vi

Iout = 40.Id.Vi

Which is a multiplication of Id with Vi, or a modulator.

Now, lets pretend that the diode equation is linear:

Id = Io.(1 + k.Vd)

gm is then

gm = d(Id)/d(Vd)

therefore

gm = Io.k

Thus the gm is a constant, independent of applied current or voltage.
This
means a transistor using this as a control parameter would give an
output:

Iout = gm.Vi = Io.k.Vi

Which has no multiplication factors.

To achive muliplication one can consider adding a nonlinear term

Id = Io.(1 + k.Vd + cVd^2)

gm = Io.(k + 2c.Vd)

and subsequently

Iout = Io.(k + 2c.Vd).Vi

Which does have a multiplication term.

This can be formalised. To achieve multiplication from a gm source, we must have

Vo = gm(V1).V2.

That is, gm must be a function of V1. However, Gm is defined by Vi as

gm = dI/dVi, therefore

I = integral(gm(Vi))

If gm(Vi) is represented by a Taylor expansion, any required terms linear in Vi will integrate to Vi^2, that is

I = aV^2 + terms...

That is, the I verses V relation must be non-linear to achieve a gm that is a function of voltage or current.

I am amazed at all the illegal advice that goes on here regarding jamming the neighbors, cutting power line neutral etc.

These are illegal and some one not knowing any better may try it.

A good lawyer can take an offender to task and they are in BIG trouble. Particularly when you post EVIDENCE of your intent here.

Best check your city ordnances for proper measures to deal with noisy neighbors. For CB salty talk -- TURN IT OFF.

Stay within the law -- your pocketbook will appreciate that.

Big lawsuits lasting for years have taken place over illegal activities as proposed here.

Keep calling the cops on them, if everyone on the block complains they will deal with the bums, will take some time.

Letter writing campaign, easy on the pc ! Send certified letter of complaint to the Poice Chief and Mayor if you have one. Call the TV stations too !

Stay within the laws, there could be someone behind the bums to keep them going,

perhaps to lower YOUR LAND AND PROPERTY VALUES to buy up homes cheap.

I have seen this before up north, they bring in bums to run down the block and then
snap up the homes and land far less then the going price would have been without bums
living on the block.

If everyone on the block kicked in a few bucks you could hire a lawyer to deal with this.

Keep cool and you will be better off along with your neighbors to reclaim your block.

Hi,

Try using an extension cord to plug your radio into another outlet on other
side of house
as a test to see if the noise is lowered or eliminated.

Good advise from other posters.

FSK SIGNALS.-In fsk the rf signal is shifted in frequency (not amplitude) between "key-open" and "key-closed" conditions. The signal amplitude remains essentially constant. View (A) of figure 2-3 represents the letter "F" keyed as a shift in frequency between mark and space. The normal frequency condition with the key open is a space. Recall that this may be either the lower or higher frequency. When the key is closed, the frequency instantly changes to the mark value and remains constant during the marking interval. Opening the key again returns the frequency to the space frequency. Midway between the mark and space frequencies is the assigned channel frequency

Indeed. This is essentially the way it works.

So, as far as picking up women, one must always act in such a manner as she would want in her offspring. Walk tall, show no sign of weakness etc... The best way to pick up a women is to make sure that your with lots of other women. They want offspring that are similar attractive with other women. For, men its big bad news if a women is seen with lots of men. Too much probability that she's having someone's else genes, and as you say, having some sucker pick upon the rearing tab.

No doubt about it! Though my point was something different.

A recursive filter would probably count as LTI since the coefficients don't change (at least in the kind I'm thinking of). An adaptive filter, though, might not, though it'd be time-invariant between adaptations.

A DSP / math-oriented guy would look at a mixer or modulator and say "See, it's linear!" because the stage is a-times-b. Look, no second- or third-order terms! An EE guy would say "it generates new frequencies, it's not linear." The EE guy means "function of one variable that only changes the scale or intercept".

Just terminology differences, is all it is.

I assume your comment is made in jest, but there *are* wimmin out
there who will do this. One case that springs to mind was this poor
sap who lived in Texas (IIRC) who was ostensibly happily married; he
and his "wonderful wife" had been "blessed" with four "beautiful
children" - as invariably happens in America, of course. :-) Anway,
some chance event led to the discovery that one of the kids couldn't
possibly have been this father's. It was thought that was the extent
of the infidelity, but it turned out on further investigation that
none of the children were his *and* they all had *different*
fathers! Understandalby the poor bastard was devastated when he
learned this - as indeed where the children; they'd all grown very
close to him and he to they during their lives. Most were in their
teens. Bad time for such revelations. :-(
I'll wager that bitch had some explaining to do! :->

I don't think he can be suggesting that, Kev. Much of these
discussions have been above my head as you may imagine, but suppose
he's only referring to "linear" to mean the part of the graph that's
as close to a straight line as you can get with a decent device; the
central point of which the operating point is typically set on in
Class A? Could that account for the misunderstanding?
Probably not but I just thought I'd mention it in case...

No its not in jest. There has really been a good deal of real research done on this. In fact, the was a TV program on it the other day. The researches get women to rate people based on attractiveness. There are well studied features that relate facial features and behaviour, for example "manly" or "caring" characteristics. They show that during the critical ovulation period, women much prefer the manly faces rather then the caring faces, and visa versa doing other times.

Of course, women don't generally do this consciously, but it is the way it is. As I said, whatever strategy results in the best Replicators, is what we observe.

And to Roy, it occurred to me that you may have misunderstood my comment on "women selects", I was of course, meaning selects to have sex with, not as a long term partner.

Ok lets simplifies it
From URL:
http://wombat.doc.ic.ac.uk/foldoc/foldoc.cgi?Frequency+Shift+Keying

<communications> (FSK) The use of frequency modulation to transmit digital data, i.e. two different carrier frequencies are used to represent zero and one.

FSK was originally used to transmit teleprinter messages by radio (RTTY) but can be used for most other types of radio and land-line digital telegraphy. More than two frequencies can be used to increase transmission rates.

Also URL: http://www.its.bldrdoc.gov/fs-1037/dir-016/_2347.htm

frequency-shift keying (FSK): Frequency modulation in which the modulating signal shifts the output frequency between predetermined values. (188) Note 1: Usually, the instantaneous frequency is shifted between two discrete values termed the "mark" and "space" frequencies. This is a noncoherent form of FSK. Note 2: Coherent forms of FSK exist in which there is no phase discontinuity in the output signal. Synonyms frequency-shift modulation, frequency-shift signaling.

Also see URL:
http://searchnetworking.techtarget.com/sDefinition/0,,sid7_gci213936,00.html

Frequency-shift keying (FSK) is a method of transmitting digital signals. The two binary states, logic 0 (low) and 1 (high), are each represented by an analog waveform. Logic 0 is represented by a wave at a specific frequency, and logic 1 is represented by a wave at a different frequency. A modem converts the binary data from a computer to FSK for transmission over telephone lines, cables, optical fiber, or wireless media. The modem also converts incoming FSK signals to digital low and high states, which the computer can "understand."

No need I've been sending and receiving RTTY for years so I know what
FSK and AFSK is and what it sounds like.
The question was..
Which frequency is the carrier frequency as regards HF and VHF
Beacons, and I suppose A/FSK data, in the Amateur service.
The Mark, the Space or in the middle for Amateur usage (the frequency
you log in your logbook).
Keying can be normal or inverted making the space either higher or
lower than the mark so saying that the mark is the carrier frequency..
occasionally.. is'nt much use is it ?.

Not quite. She's out of the game for considerably more than 9 months
and not only that, she's run off her feet nurturing for years to come.
Consider the disparity in investment:
Male: 15 minutes 'work-ouk' producing two teaspoons of semen. Total
cost to male: the semen that would be naturally lost anyway, plus
maybe having to forego the time to down half a pint of beer with his
chums in the local pub.

Female: 9 months carrying, physical disfigurement, much physical pain
and then she's lumbered with a unceasingly demanding child who keeps
her from doing anything else than looking after it, morning noon and
night for years to come. Opportunity cost: work it out for yourself
but it's *enormous*. She's choosy because her investment into the
project is vast and has to be worth it in the long term. He's not
because his investment is negligable. Anything in a skirt will
suffice, particularly after a few beers.

>want to take Liz Harley to bed.

No thanks. It's *she* who'd have to be bloody well-off. I'm rather
fussy, I'll have you know.
But I'd agree that physical appearance is the single most significant
aspect with the accent on *single* and probably has been for all time
so far as the human race is concerned.
Shows of wealth are often a bit misleading. Wimmin do find them highly
attractive. But the reason they *think* they find them attractive
(nice house, nice holidays, nice car etc) and not the same as the
real reason they do, which is simply their genes trying to ensure
for themselves that the mate in question will be able to give the
offspring the best possible shot at life: better diet, better
schooling, better upbringing, better adult prospects of that offspring
attracting a similarly classy mate for him/herself.

I believe it is pretty much standard that the Mark is the lower RF frequency. For AFSK using a SSB transmitter that means that the audio Mark tone is the higher frequency and the transmitter is set to LSB which inverts it to the lower RF frequency.

For amateur and most commercial operation, the RF Mark frequency is generally given as the assigned frequency. The military uses the center, half way between Mark and Space as the assigned frequency. Because they assign channel frequencies as the center of the assigned bandwidth, this always puts the FSK signal in the center of the channel.

Once again, it is *not* the non-linear aspect of it that "produces" the
multiplication (frequency translation in this case).

Maybe this will help you:

The Circuits and Filters Handbook
0849383412
CRC Press (c) 1995
Wai Kai Chen - Editor in Chief

Transconductance Multipliers

A direct, straightforward technique to realize the multiplication
function exploits the possibility of controlling the transconductance
of transistors through an electrical variable (current or voltage).
Although this feature is exhibited also by unilateral amplifiers,
most practical realizations use differential amplifiers to reduce
offset problems and enhance linearity [25]. Figure 32.32 shows a
generic schematic for a differential amplifier, consisting of two
identical three-terminal active devices with common bias current.
The expressions on the right display its associated transconductance
characteristics for npn-BJTs and n-channel MOSTs, respectively [25].
These characteristics are approximated to a first-order model as

i_y*v_x
i_z ~ --------- (BJT), i_z ~ sqrt(Beta*i_y)*v_x (32.39)

4*U_t

[~ := "approx. equal to"]

which clearly displays the multiplication operation, although restricted to a rather small linearity range. Practical circuits based on this idea focus mainly on increasing this range of linearity, and follow different design strategies. Figure 32.33 shows an example, known as the Gilbert cell, or Gilbert multiplier [23]. Corresponding realizations using MOS transistors are discussed in [2] and [53]. Sanchez-Sinencio et al. [61] present circuits to realize this multiplication function using OTA blocks. On the other hand, [17] presents a tutorial discussion of different linearization techniques for MOS differential amplifiers.

There you have it. For the BJT, i_z is linear according to i_y or v_x. That is, you change v_x by 1 dB and the ouput changes by 1 dB provided the coefficient for v_x (which is i_y) is not zero (vice versa for i_y too). Note all the talk about linearity from the circuits perspective: '...enhance linearity," and "although restricted to a rather small linearity range," and "Practical circuits based on this idea focus mainly on increasing this range of linearity," and "...a tutorial discussion of different linearization techniques." So explicitly again: *non-linearity is not required or even wanted for this particular multiplying function*. The circuits perspective of linearity is consistant with the Signals and Systems perspective. That some engineers don't know the definition is notwithstanding.

The following from Lathi may help get you up to speed on the linearity property:

SIGNALS, SYSTEMS AND COMMUNICATION
B. P. LATHI
Copyright ï¿½ 1965 by John Wiley & Sons, Inc.
Library of Congress Catalog Card Number: 65-22428
SECOND CORRECTED PBINTINC, SEPTEMBER, 1967

pp2-4

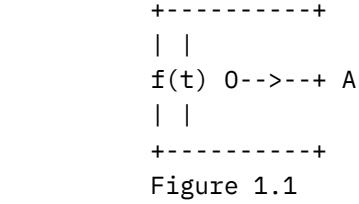

Figure 1.1

1.1 PROPERTIES OF LINEAR SYSTEMS

For every system there is an input signal (or driving function) and an output signal (or response function) (Fig. 1.1). A system processes the input signal in a certain fashion to yield the output signal. The word linear at once suggests that the response of a linear system should change linearly with the driving function (note that this is not the same as saying that the response should be linearly proportional to the driving function, although this is a special case of linearity); that is, if r(t) is the response

to f(t) then kr(t) is the response to kf(t). Symbolically, if

f(t) -> r(t)
then kf(t) -> kr(t) (1.1)

The linear system, however, implies more than Eq. 1.1. We define a linear system as a system for which it is true that if r1(t) is a response to f1(t) and r2(t) is a response to f2(t) then r1(t) + r2(t) is a response to f1(t) + f2(t), irrespective of the choice of f1(t) and f2(t). Symbolically, if

f1(t) -> r1(t)
f2(t) -> r2(t)
then f1(t) + f2(t) -> r1(t) + r2(t) (1.2)

Equation 1.2 actually expresses the principle of superposition symbolically. Thus linear systems are characterized by the property of superposition. We may consider Eq. 1.2 as the defining equation of a linear system; that is, a system is linear if and only if it satisfies Eq. 1.2, irrespective of the choice of f1(t) and f2(t).
Sometimes the condition is stated in the form,

aï¿½f1(t) + bï¿½f2(t) -> aï¿½r1(t) + bï¿½r2(t) (1.3)

irrespective of the choice of f1(t), f2(t) and constants a and b. This will be seen to be exactly equivalent to Eq. 1.2. Note that Eq. 1.2 is stronger than and implies Eq. 1.1.

1.2 CLASSIFICATION OF LINEAR SYSTEMS

Linear systems may further be classified into lumped and distributed systems. They may also be classified as time-invariant and time-variant systems. We shall briefly discuss these classifications.

Lumped and Distributed Systems

...

Time-Invariant and Time-Variant Systems

As already mentioned, linear systems can also be classified into time-invariant and time-variant systems. The systems whose parameters do not change with time are called constant-parameter or time-invariant systems. Most of the systems observed in practice belong to this category.

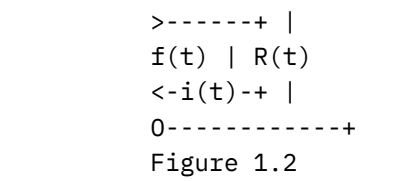

Figure 1.2

Linear time-invariant systems are characterized by linear equations (algebraic, differential, or difference equations) with constant coefficients. Circuits using passive elements are an example of time-invariant systems. On the other hand, we have systems whose parameters change with time

and are therefore called variable parameter or time-variant (also time-dependent) systems. Linear time-variant systems are characterized by linear equations with time-dependent coefficients in general. An example of a simple linear time-variant system is shown in Fig. 1.2. The driving function f(t) is a voltage source applied at the input terminals of a series R-L circuit where the resistor R(t) is a function of time. The response is the current i(t). Note that the principle of superposition must apply for a system to qualify as a linear system whether time-variant or time-invariant. The reader may convince himself that the system shown in Fig. 1.2 is a linear system. A linear modulator is another example of linear time-variant system. In this ease the gain of the modulator is proportional to the modulating signal.
The system characterized by Eq. 1.4

d^2r dr
---- + aï¿½-- + bï¿½r = f(t) (1.4)
dt^2 dt

is a linear time-invariant system, whereas the system characterized by Eq. 1.5

d^2r dr
---- + -- + (2ï¿½t + 1)ï¿½r = f(t) (1.5)
dt^2 dt

is a linear time-variant system. Note that both these systems satisfy the principle of superposition. This can be easily verified from Eqs. 1.4 and 1.5.
It is evident that for a time-invariant system if a driving function f(t) yields a response function r(t), then the same driving function delayed by time T will yield the same response function as before, but delayed by time T. Symbolically, if

f(t) ï¿½> r(t)
then f(t-T) -> r(t-T) (1.6)

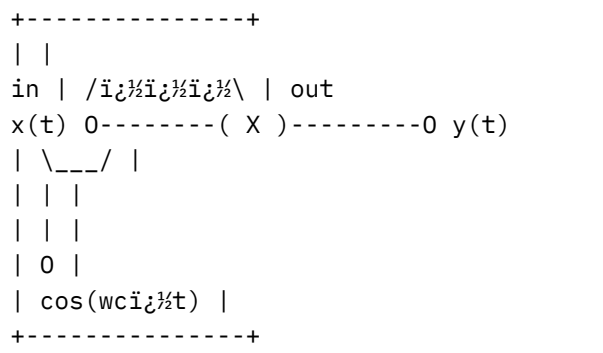
This property is obvious, in view of the time invariance of the system parameters. Time-variant systems, however, do not in general satisfy Eq. 1.6.

Some of Lathi's key statements with regard to this thread are:
1. "... note that this is not the same as saying that the response should be linearly proportional to the driving function, although this is a special case of linearity"
2. "Linear systems may further be classified into lumped and distributed systems. They may also be classified as time-invariant and time-variant systems."
3. "...linear systems can also be classified into time-invariant and time-variant systems"
4. "Linear time-variant systems are characterized by linear equations with time-dependent coefficients in general."
5. "A linear modulator is another example of linear time-variant system.

In this ease the gain of the modulator is proportional to the modulating
signal."

Note that these remarks are from pp2-4 of text for a BS level course in the
EE curriculum. You can't get more basic than that.

With regard to #4 & #5 specifically, the following is a linear system with
time dependent coefficients *and* is also a "linear modulator":



I used this example early on to emphasize the points of #4 & #5. I made
it as simple as I could think of for the purpose of making it simple for
you -- all to no avail. After all this work, I really hope you finally
"got it," because if you have not, I am done helping.

~~~~~~~~~~~~~~~~~~~~~~~~

"No. Its Yes. Non-linear action generates the multiplication products. I
was not drawing any real distinction between class c and b in this
context. The practical difference is minimal. They both do not amplifier
the waveform in a linear manner. I was not meaning to infer that it was
an "only" c. I was referring to the fact that you need at least some
method that generates non linarity." -- Kevin Aylward

"You can not achieve multiplication without a non-linear circuit."
-- Kevin Aylward

But the worm does turn:

> It should go without comment that when one analyses the simple
> transistor multiplier that one only selects the first order linear term,
> and that this is term that generates the multiplication.

I see you are finally coming around, or maybe. One can never be too sure.

> This is trivially obvious, and was
> what I showed in my original analysis, gm is
> inherently a small signal property.

Yes, and it is all you need for "multiplication." Your original claim
that "non-linearity" was "required" for multiplication was false, as
I wrote some 10,000 or so words ago.
~~~~~~~~~~~~~~~~~~~~~~~~

Back and forth,... you are all over the map.

> Indeed, as this is only valid for
> small signals, more complex multipliers log the input signal so that in
> conjunction with the exponential relation results in perfect
> multiplication at all signal levels, originally due to Gilbert I might
> add.

Doesn't matter. Non-linearity is not required for the modulation to occur
and that is what started you out on your march. You said it was, you
were wrong.

> This confusion here appears to me to be one of semantics or x-wires, as
> is often the case on strongly held, but oppositely apposed views. gwhite
> claims that you don't inherently require a non-linear device to achieve
> multiplication, ...

You are squirming. That "nothing is perfectly linear" is irrelevent.
Linear circuits are popular and much work goes into making non-ideal
(in the sense of being non-linear) devices appear as linear as possible.
Finally, the non-linear aspect (although ever present in some amount) is
not requisite for modulation to occur. If anything is trivally obvious
it should be that no device is a perfect ideal in *whatever* manner ideal
has been defined.

> I claim that all practical devices have a non-linear
> transfer function, ...

That is not now, nor has it ever been under contention.

> ...and it is this transfer function that results in
> multiplication.

Well it can... sure. That is not now, nor has it ever been under
contention. But it is not *only* that aspect that can produce the
multplication. The actual configuration can use the first order terms
alone to acheive the multiplication.

To the extent the original circuit was non-linear, it was not that
non-linear aspect that was needed or even desired to produce the
modulation. In fact, a lot of work goes into linearizing the
transfer characteristic rather than the opposite. That the LO or
carrier port of the circuit can be driven Class C or D is
notwithstanding: that non-linear aspect is not inherently needed
for the modulation to occur. It exists more as an annoying non-
ideality that simply must be acknowledged and then mitigated in
many modulation applications.

The reason for Class C or D is for efficiency, as I wrote long ago.
The amp is not Class C or D "so that the modulation will occur."
In fact, the point is to find out how Class C or D can be used and
still achieve the desired effect. For tubes, that will likely be
plate modulation. The desire is for efficiency, and then to find
a way to make it work effectively. The point was not to "use Class

C or D so that modulation will occur."

> I don't believe we are arguing about the same point.

Dude, it is pretty straightforward stuff. If you don't know what
is under discussion you might want to think before you write how
stupid someone else is.

> I have better things to do.

Gee, thanks for making it so easy. So what if there are some
things you are shaky on? Get over it -- that is life. No one
knows everything.

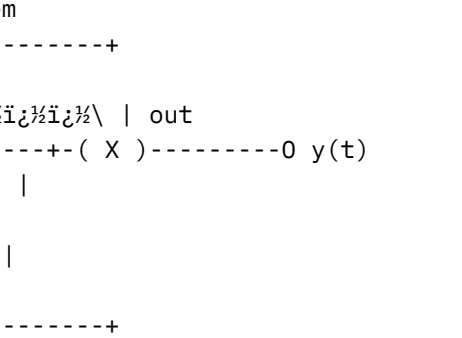
> is a function of voltage or current.

I don't know what your point was with all the gm stuff, but if you hook
it up like this:



...then the system is indeed a non-linear one [y(t) = x(t)^2].
This squaring function is a perfect example of why I wrote a long
time ago: "'Multipliers' cannot be generally stated to be either
linear or non-linear. A system which includes a multiplier must
be put through the linearity test to see if the configuration is
linear or non-linear. IOW, it can be either."

It takes a lot of work for designers to produce linear characteristics
in their linear multipliers. They like to draw straight and long lines
on their z = xï¿½y graphs. That one non-linear operation is cleverly used
to cancel another (and get those nice long straight lines) is a design
detail. The bottom line is the end linearity, the linearity they use as
a selling point.

From AN-531
The analysis of operation of the MC1496 is based on the
~~~~~~

ability of the device to deliver an output which is proportional
to the product of the input voltages V_x and V_y. This holds true
when the magnitudes of V_x and V_y are maintained within the
limits of linear operation of the three differential amplifiers in
the device. Expressed mathematically, the output voltage
(actually output current, which is converted to an output
voltage by an external load resistance), V_o is given by

V_o = Kï¿½V_xï¿½V_y (1)

... The MC1595 multiplier contains the basic circuit configuration
of the MC1496 plus additional circuitry which results in linear
multiplier operation over a large input voltage range.
...
Figure 3 shows the MC1496 in a balanced modulator
circuit operating with +12 and ï¿½8 volt supplies. Excellent
gain and carrier suppression can be obtained with this circuit
by operating the upper (carrier) differential amplifiers at a
saturated level and the lower differential amplifier in a linear
mode...
Operating with a high level carrier input has the
advantages of maximizing device gain and insuring that any
amplitude variations present on the carrier do not appear on
the output sidebands. It has the disadvantage of increasing
some of the spurious signals...
[Saturation has nothing to do with the multiplication function.
In fact the extra non-linearity has the caveat of spuroius products.]
...
Operation with the carrier differential amplifiers in a
linear mode theoretically should produce only the desired
sidebands with no spurious outputs. Such linear operation is
achieved by reducing the carrier input level to 15 mV rms or
less.
This mode of operation does reduce spurious output
levels significantly...
[Again, non-linear operation is not required to produce the
modulation. In fact, it reduces spurious products that would
otherwise need filtering, if possible.]

And it goes on and on and on and on. Linear means linear.
Get over it.

1838. UHF 70cm receiver schematic

You don't even need a bridge. Just put a BNC "tee" in line between
any signal generator and any detector. Now put your LC series
resonant tank on the third port of the tee. At resonance, the LC
will suck out the signal and you will see a dip in the response.
This method is more accurate than the bridge method you describe.

Regarding small inductances: the capacitor has to have negligible
inductance compared to the inductor you want to measure.

I have already pointed out the light dependant resistor in another post in this thread, so I did already do a retraction and a qualification on this point. This was a minor oversight. The distinction is whether or not the controlling elements output terminals are connected to its controlling terminals. If the controlling terminals, are connected to the controlled terminals then we have a non-linear resister de-facto. A resister can only be linear if its resistance does not depend on the current through it, or the voltage across it.

In the case of the transistor, the gain is set by its small signal resistance re=1/gm. However, the control of the value of gm is by its own current, therefore it has to be non-linear.

An easy way to see this is the transistor is equivalent to a voltage being applied across a resister re. Make the voltage a sine wave. Now apply an additional current through the resister. If the resister was linear, only an additional fixed dc current would flow, the peak to peak value of the sine wave would not change.

I retracted this in the pure technical sense. I restricted the claim to electrical connected, real devices. However, this statement was made in support of my fundamental claim that the Class A amp you presented achieved multiplication specifically because of its non-linear transfer function due to the diode equation. I stand by that claim, which is the one that matters for this discussion. I have proved this, as an extension to my prior diode presentation, in detail below.

You shouldn't have bothered, it was much wasted much effort. I
mathematically proved that the diode has to have a non-linear transfer
function in order to obtain a gm that varies with a control signal, and
thus achieve multiplication.

The fact that you are unable to explicitly, understand, discuss and
refute that proof on mathematical points says much about your ability
and credibility.

> was, you were wrong.

Nope. I am correct. I prove it below. Excluding, my retraction of the
ideal, unavailable VRC, or the light bulb and light dependant resister,
where the controlled terminals are not connected to the controlling
terminals. This was a minor slip-up as I was implicitly referring to
transistor type circuits. I regret not being more precise, but nobody's
perfect.

Not in the transistor case it can't. I have proven otherwise. All you
are doing here is throwing away non-linear terms after the fact. This
dose not mean that non-linear terms are not required in order to achieve
the final linear result.

Cut the bullshit, and show me an actual mathematical derivation
supporting your view, rather than quoting end results from books you
don't understand.

>
> I don't know what your point was with all the gm stuff,

I know you don't. Its quite sad really. You have no idea of electronic circuits and are unable to do a derivation of the gain of an amplifier. I honestly though you were sufficiently qualified to understand these mathematical details, obvious I was wrong.

I am taking a guess here that you still wont understand my black and white disproof of your claims, because you simple don't have the mathematical competence to do so, nor the competence to understand that you lack such competence.

>but if you
> hook it up like this:

Oh dear...

I showed that if gm = kVi., i.e. the required linear gm, then the only way to achieve this was if its defining equation was non-linear. This is because gm=dI/dv. Linear gm vith its own current controlling it, inherently implies nonlineaity of the I/V graph. The fact that you introduce some daft multiplier connected up as a squaring circuit shows you just haven't got a clue.

{snip irrelevant}

Notes:
Vin1 is applied across an effective resistance re=1/gm. To get any gain change gm,re must be a function of either the current or voltage i.e. Vin2 or Ini2, in this case its the current though it. A resistance that changes is value based on the current through it is necessarily a non-linear resister. Its that simple.

{snip irelevent waffle}

Stop quoting text you don't understand. Show me real mathematical derivations.

>

> V_o = K*V_x*V_y (1)

>Get over it.

Err. where is your derivation of this equation? I wager if you could, you would.

Let me do it for you.

The small signal output current of a transister amplifier is given by:

Iout = V1*gm

Where gm is the transister gm, and is given by, gm=d(Ie)/d(Vbe)

Ie is the emitter current, Vbe = V1 is the voltage across the base emitter diode, and V1 is the input signal.

Now, please let me know where you disagree with any exact point.

I am now going to assume that the transistors gm is controlled by another current I.

That is, gm = k.I

so that, from the above expression for Iout:

Iout = V1.k.I

That is, a linear multiplication of I and V1. All well and good so far.

However, we noted that

gm = dI/dV, so that we must have

k.I = dI/dV

or

dI/I = k.dV

and upon solving this differential equation, we obtain

I = c.exp(V.k)

That is, to achieve linear multiplication by this transistor gm method, it necessarily requires a non-linear relation between I and V for the transistors gm characteristics. This forms a proof of my statement that the class A modulator achieves such modulation by a non-linear process.

If there's not a whole lot of 70cm activity near you, you can build a simple single-conversion NBFM receiver with any of several chips from this product line (http://www.semiconductors.philips.com/similar/SA604AD.html) in an afternoon. Just leave the front end untuned. You won't have any image rejection with a 455 kHz IF, but chances are better than good that you won't have any images to reject on that band.

DigiKey sells ceramic filters (TK2332-ND is a good choice for NBFM as well as AM applications) and slug-tuned discriminator coils for 455 kHz (e.g., TK2502-ND) for use with the Philips chips.

A Mini-Circuits POS-500W VCO (200-500 MHz, -100 dBc/Hz phase noise, +10 dBm out) would give you coverage of both 220 and 440 MHz. Tune it with a 10-turn or 20-turn precision pot and a well-filtered power supply. Not the greatest stability, but it'd work. It also wouldn't be too hard to add a digital frequency display with a microcontroller (to subtract the 455 kHz IF) and prescaler....

All talk, then. Pity, I would have enjoyed the sport of a contest. It
seems this issue has been smothered with words. If one could apply the
"science" to "design", the words would have more meaning.

> Regarding small inductances: the capacitor has to have negligible
> inductance compared to the inductor you want to measure.

Another caveat: keep the leads between your LC to be measured and the coax tap point very small compared with the wavelength. For example, if you have a quarter wave of line between the "T" and the LC, at LC resonance it reflects back an open instead of a short. And if it's even just 0.05 waves, for example, with 50.66nH and 50pF on the end, the suck-out frequency drops from 100MHz (the LC resonance) to about 83MHz, and you're going to make a big error in your estimate of the inductance. That 0.05 waves of line is only about 4 inches at 100MHz. In a typical BNC "T", you probably have 0.01 waves at 100MHz, and even that shifts the apparent resonance by over 4MHz in the example given, resulting in 9% or so error in the estimate of L. Looking at it another way, not only does the capacitance have to have negligible inductance compared with the inductor, but the connection to the line must also. -- So though the return-loss-bridge technique where a Zo resistor is added may not be as accurate as a resonance measurement, it does have the advantage that it can be done at the end of a line without regard to the line length, and sometimes that can be very handy.

Another poster asked about using these techniques to find antenna resonance. The problem for the typical ham's instrumentation is that the antenna is generally a low Q and presents a fairly high resistance (in the neighborhood of 50 ohms, presumably, but not necessarily very close to that) at resonance. It's easy enough to measure the system resonance (lack of reactance) at the shack end of the line feeding the antenna, but AFAIK, most hams don't have an analyzer they can calibrate at the end of a piece of transmission line like you can with modern lab network analyzers. So you'd have to measure the impdeance (R+jX, complex value) you see at the shack end of the line and put that into a calc that backs the line out so you can know the impedance at the antenna feedpoint. -- But why bother? It doesn't generally matter whether an antenna is _resonant_ or not, only that it radiates efficiently with the desired pattern, and that you have a way to get power to it efficiently. So at least at a given frequency, you can

trim the antenna and/or put a small matching network at the antenna to get the line SWR low enough to suit you. If you can stand the resulting SWR over the range of freqs you want to use, then any additional matching can be done at the shack end of the line.

Yet another note. ;-) When the measurement is done in a system with a 50-ohm impedance, and the components (L and C) in the resonant tank have fairly low reactance, you won't get a very sharp null with the return-loss bridge and additional series R as the OP suggested. The additional R makes the tank Q very low. With Rick's suck-out circuit suggestion, you'll need a detector with pretty wide dynamic range (like a receiver perhaps) to see where the deepest null occurs, because even fairly far off resonance, there will be significant attenuation.

Cheers,
Tom

1852. Re: Phase modulated carrier thru rf amp tank circuit??

> prohibit or inhibit the abrupt phase changes in the signal. thanks

The ensuing discussion reminded me of when I learned about required tank circuit bandwidths for some given modulation. Can you say, "hit myself over the head with a hammer"? In this particular case, I wanted a quick output pulse at 150MHz, and my first trial was to pulse a lower-power stage in a multiplier chain. The output was anything but a fast pulse! But it was still fairly wide bandwidth, compared with what's needed in voice-bandwidth systems or probably even video. The solution, after I realized what was going on (didn't take long...a lot shorter time than it took to build the thing, for sure!), was to pulse-modulate the screen of the power amplifier stage. Then the main limitation to RF pulse rise time was the Q of the tank and the ability of the power tube to drive that tank with high current pulses to quickly build up the RF level.

So as others have noted, you WON'T change the phase 180 degrees in half a cycle of the RF...it will take lots of cycles...but that's OK because you don't NEED to change it that fast. For example, if your digital bits last for, say, 1000 cycles of the RF, that would be a bit time of 286 microseconds, or 3500 baud, at 3.5MHz carrier frequency.

Please note that at the receive end, you will do FAR MORE RF filtering than on the transmitter end (in the RF tank circuits)! In fact, on the transmitter end, you better band-limit the modulation signal somehow, because the RF tank circuits will NOT limit it enough, in general. So there will be filters in the modulation input path that make SURE that you don't even try to change the phase that quickly anyway. That's because such abrupt changes -- in phase or in amplitude -- result in wide transmitted bandwitdh and cause interference to other users of the spectrum. So the whole system, including the modulation technique, data rate, transmitter, receiver, and decoder/demodulator, work together to transmit the information in "just enough" bandwidth to get the job done, and in general they DO NOT use abrupt changes in phase or amplitude or frequency.

Cheers,
Tom

That would be the usual place to put a frequency divider in a PLL
chain. Could it be programmable? Could it be a prescaler? Google
wasn't very helpful in this case.

In this particular quotation. But the concept is the same - when the transmitter is at 'rest', it sits at the 'mark' frequency. Under modulation it shifts to the space freq.

When a RTTY station modulation stops prior to turning it over to the other station,the last thing you hear before he cuts the carrier is his 'resting' frequency-the mark frequency..

Hey, I didn't invent the term!

I recall the term being used from around 30 years ago

1860. Best way to feed a vertical?

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-11 04:23:56 UTC
From: mcalhoun@ksu.edu
Message-ID: <bjotcs$fbu@unix1.cc.ksu.edu>
Source record: 32727

I need to re-erect (after major house remodeling) a 33-foot flag pole
(also known as a 40-meter vertical) and would like to know the best
way to feed it.

Prior to the remodeling, the base of the pipe was held a few inches above
ground and the antenna was fed by simply connecting a 50-ohm coax shield
to a ground rod (with radials, etc.) and the center conductor to the pipe.

I later added an inductor (from memory: maybe 30 turns of B&W with a
diameter of maybe an inch and a half) from the base of the antenna to
the ground rod, hoping it would discharge any static electricity that
might build up. The inductor changed the tuning a little bit but I
never saw any other differences.

Any suggestions?

1861. need advice aligning a vaccum tube spectrum analyzer

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-11 06:18:07 UTC
From: The Eternal Squire <eternalsquire@comcast.net>
Message-ID: <aNKdnYQwdoAIk_2iXTWJiw@comcast.com>
Source record: 32728

Hello, everyone.

It looks like I have a new, exciting, rather daunting project ahead of me. I'd like some advice
from anyone interested in providing it.

I have now adopted into my household (and home lab) a Lavoie LA-18M spectrum analyzer unit,
circa 1950's, completely tubes plus a few microwave crystal diodes. I also have a manual.

The manual is missing the overall schematic diagram of the entire unit but has schematic diagrams
of all the major sections, such as the IF strips, and it also has general troubleshooting procedure.

Given its age, it is in outstanding condition, because everything about it works. Given the fact that
I bought it for only 50 bucks, as a working antique it is an absolute treasure. However, I am concerned
about the weak signal sensitivity.

For calibration equipment, I have a late year 100 Mhz analog scope, a Wavetek 3001 signal generator,
and a digital multimeter, if that helps.

With the signal generator I was able to determine that the minimal discernable signal at 10 Mhz was
-34dBm. The manual on the Lavoie indicates that the sensitivity at that frequency should be 40 microvolt,
so that seems to tell me that age has affected the sensitivity.

There are several IF strips on the unit, and the manual tells me which strip needs to be aligned first, but
it does not go into any detail about how to align each of the IF strips for best performance... it merely
says "replace IF strips as necessary".

If I had a time machine I could probably follow the manual's suggestions, but short of that I am out of
luck there. I also understand that the alignment procedure for AM IF strips is differerent from FM IF
strips, and for IF strips used by spectrum analyzers it could be different still.

So, does anyone have any advice for me on how I should peak each vaccum tube IF strip. I will supply

specific information on each, and will email scans of the schematics for each, to those who want to
consider the problem.

Thanks,

The Eternal Squire

1862. Pixie II help needed!!!

> to 40 meters instead of 80 meters by switching the crystal and one inductor.
> Does anyone know if this mod could be carried a little farther and take this
> little gem up to 20 meters??

Yes, the mod works for 20 meters as well. BUT you have to make sure that
the RF choke on the PA transistor is not self-resonating on 20m,
otherwise you burn up the 2N2222 with excessive current.

I do have built a Pixie II for 20m. I certainly had the problem
mentioned above, but I have no oscilloscope for troubleshooting.
Moreover there are other drawbacks:
- the LM386 is muuuuch more likely to produce "hum" or "motorboat" than
on lower frequencies (I tried plugging all my XTALs from 2 to 15 MHz)
- you are likely to loose sensitivity in the receiver (but you might
consider using a separate RX at the beginning)
- the 2N2222 PA might not give as much power output as on 80-40m

Go ahead and let us know how it progresses!

I don't have any knowledge of your particular unit, but in general the shape of the IF filters is very important to spectrum analyzer operation. Unless you use a good sweep generator and calibrated detector, or better yet a network analyzer, along with good information about what the proper IF response should be, you're almost certain to ruin the response by tweaking. You also won't recover anything like 40 dB, which is what it's lacking, by fiddling with the alignment. If I were you, I'd first make sure that I measured the MDS properly. If the unit has a selectable bandwidth (or dispersion, as I recall it was called), be sure it's at the correct setting for the specified MDS, since the bandwidth will directly impact the MDS. (This won't, however, account for any but a small part of the total shortage.) With about 40 dB deficiency in MDS, you should be looking for something that's broken, not just out of alignment. I'd suspect the diodes first, since they're fragile and vulnerable. Next I'd check the tubes. You should be able to trace a moderate amplitude signal through the analyzer with your scope, and find replacement parts on eBay.

>With about 40 dB deficiency in MDS, you should be looking for something
>that's broken, not just out of alignment.

The worst thing you can ever do is start to re-align something that's actually broken. It won't make anything better, and can easily make things worse.

Electronic equipment is quite unlikely to wander so far out of alignment that it completely stops working. So if does stop (and -40dB pretty much qualifies as "stopped") you know that something has broken.

In that case you need to look for it, find it, and then either fix it or change it. There is no other way.

There are many different ways to find a faulty component - but *none* of them begins with: "Before I do anything else, I'm going to twiddle every adjustment in sight."

Not to me aint. The case is closed.

The problem with gwhite, is that his arguments are all based on "an appeal to authority", and we all know that is not the way science is done. He pastes reams of stuff without the slightest idea of what the documents are talking about. The assumption being that such documents back him up. They don't. He hasn't presented one, not even one derivation of his claim, only end results. This is typical of all vacuous claims. It says so in the bible, so it must be true sort of thing.

On the otherhand, he does have a very valid point that one, could in principle, make a modulator that does not depend on an inherent non-linearity, he just happened to pick the wrong examples, and the wrong person to debate with. He obviously learnt the basic concept from a coarse he took, but never understood
enough to know when and how to apply it. For the active bipolar or fet case, the gain setting is gm based, and this gm is electrically controlled by the value of its
own current, hence, as a I proved, must have a non-linear V/I curve. However, for example, in a passive case, things are different. If one used a fet as a passive voltage controlled resister, the resistance is a

function of the gate source voltage, but the control voltage is not connected accross the controlled resistance, and the resistance variation is not implied to be a function of its own current, therefore a non-linear resistance is not implied. Indeed, this technique is used in guitar phaser pedals to produce a swept notch filter, and I designed and built my
first one of those around 25 years ago, based on this concept. To make the fet even more linear, as qwhite correctly suggested, I used, as is well known standard practice, a series gate resister and feedback resistor from drain to gate. Unfortunately, I made a mistake...in my "there is only a world market for 5 computers" statement, I forgot what I already knew:-)

What contradictory posts?

As far as attitude goes, I think we can all get rather exasperated when someone else uses very strong rhetoric against ones own competence, when it is trivially obvious that such claims are completely without any merit whatsoever.

>and arguments over semantics might
> possibly be due to Kev's impared usage of English.

See below.

>If the guy's
> dyslexic or has some other comprehension problem, he might very well
> be an electronics genius but we'd find it hard to tell because this

This makes little sense. Most of my posts are very clear, although not necessarily pristine in all aspects of their structure. Any lack of comprehension of them, is often a problem with the reader.

> You view as
> expressed above is a very much more cynical one, but I'm forming the
> view that one or t'other must explain it. But Kev has admitted to
> English not being his strong suit elsewhere on the group

My fundamental problem with English is that I have a very poor memory, in conjunction with the fact that I am a two fingered typist. This results in an inability to spell or type accurately. I usually function by understanding and deriving results from basic concepts, rather than by remembering millions of facts. Unfortunately I don't always check the spell checked version that well. For instance, "simplely" might come out

as "simple" instead of "simply", making the statement "Its that simply", grammatically wrong.

> and if that's
> the case and he really *does* know what he's talking about then

Of course I do.

> I feel
> sorry for him. It must be pretty shitty and exceedingly frustrating
> for anyone in that position. I know; I've met a few and it's ruined
> their lives.

My life is quite fine thank you. I have wrote volumes of decent technical reports, with no complaints.

I usually write quite accurately, expressing exactly what I want to say in order to cover my arse. I do this explicitly, deliberately and seriously as a general rule, with the method of "Yes Minister" TV series speak. Often, it is a joy to watch other people fail to understand what was actually said. For example, suppose the Minister had read a paper indicating that a proposal of his would generate 500 redundancies. In the House of Commons, he would say "No person informed me that there would be any redundancies from my proposal". If you actually go back and check my posts, you might be well surprised how subtle some of the points are. Of course, at times I have made what might have been inaccurate statements, but this is often simply because I have temporally forgot something that I know well, or I have made an assumption, that the obvious exceptions, are being deliberately ignored for the purposes of the discussion. The issue here, is that the novice, interprets this as a lack of understanding on my part. It just gets too cumbersome addressing all the details, when only the general picture is required.

Myron
I presume the antenna is resonant ie about a quarter wave and you feed it against ground
Ground resistance is likely to be at least 20-30 ohms unless you have lots of radials and the antenna radiation resistance will be 35 ohms in theory. So the total load will be 55-65 ohms which is not a bad match to 50 ohms So you could feed it directly with coax and get away with it.

>An interesting, if irrelevant, discourse into history. :-)

If I recall correctly: these systems were set up as closed loops,
with a single current source, and with all of the transmitters and
receivers in series. The normal, resting state was to have a current
flowing through the loop, "marking" the recording medium. The active
state was to temporarily break the link, creating a "space" on the
recording medium.

This method had two advantages:

- It provided positive confirmation at all times that the loop was
intact. A broken wire would be noticed immediately even if there
was no active traffic on the wire, as it would cause all of the
recorders to drop out.

- One station could interrupt another station's transmission (to e.g.
send emergency traffic) by pressing the BREAK key on the
transmitter (or holding down the Morse sender key for a few
seconds). This would interrupt current flow in the loop, causing
all of the recorders or Morse sounders at all stations (including
the one currently sending) to lift their pens or stop chattering,
thus signalling the sending operator to cease transmission.

The terminology survived into the ASCII era, and there are still
traces of it in UART manuals to this day: the BREAK button on a
standard ASCII terminal creates a condition known as a "long space" by
changing the state of the transmission line from its resting state to
its active state for substantially longer than one normal character
time.

1874. Upconverter Weirdness

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-12 20:53:43 UTC
From: donrm@soco.agilent.com
Message-ID: <1063400023.451927@cswreg.cos.agilent.com>
Source record: 32741
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

See if you can figure this one out.

I recently bought a used Palomar VLF-A converter and am experiencing a strange frequency offset problem. WWVB 60 KHz appears about 5 KHz low on the upconvert receiver, in this case a TS-130 transceiver.

This converter was evaluated in the January 2000 pg 59 issue of _QST_ and the author had the same problem, only in his case the receiver was an ICOM IC-706.

When operating the converter into a direct conversion receiver WWVB comes out on the correct frequency. Suspecting a problem with the VLF converter's LO (3.5 MHz in this case), a peek at this LO signal with a high-end spectrum analyzer shows a clean output with very little phase noise, no spurs and exactly on 3.5 MHz.

BTW, I tried replacing the MC1496 active balanced modulator with a Minicircuits SRA-6 passive DBM, same result. I don't suspect any problems with the upconverter receiver's LO either.

So - what's going on?

Dick,

Electrolytics should be run near their rated voltage to "form" properly.
The spikes should be taken out by a parallel 100nF cap, or clipped by a
zener.

Richard,

How extremely strange. I just announced a week or so ago on a private forum that I was designing exactly the same thing. And I've also searched the net to see whether this was an original idea, and it seemed to be unique at the time. You wouldn't be another SDR-1000 owner by any chance?

BTW, I'm still trying to locate relays also. My reply at the quoted $10.00 price from CIT was "Freow! Skip it!" or something similar. As you say, 20-30 of those makes it VERY expensive indeed.

It's truly amazing what you can find while wandering through Powells.

I find it remarkable that, in a hobby that requires a multitude of non-English expressions and anachronisms, we have an old timer who's faulting someone's use of the Queens English! Presumably, W7TI also refuses QSO's with anyone who is unable to speak fluent, clear English. Even in my humble experience, I can see that such an approach to our hobby is inappropriate and one must surely feel sorry for W7TI and the small world he has limited himself to. Bill; you have my sympathy and thoughts.

Scott, on behalf of all amature radio operators who uphold the tradition of making contact with a fellow enthusiast despite the QRM around them, I wish you all the best. I, to, am in the process of selecting a suitable HF design and I'll follow this thread with interest.
For what it's worth, here's my observations of starting out at homebrewing - and I'll bet this starts a run of mail as well!:

1. Select a kit if your confidence or experience is minimal. Some kit manufacturers even offer a 'get-you-running' service to iron out those little bugs that creep in.

2. Ensure you can beg / borrow suitable test kit. You'll probably need a multimeter or two, a resonable power supply (ideally, a current-limiting one), an RF probe (do a Google search; they're easy & cheap to make), dummy loaad (again, Google) and an oscilloscope. There's nothing worse than having a circuit board on the desk & no means of knowing if it's okay to proceed with the next bit!
Other items might well include: RF Watt meter, Frequency counter, RF Generator.... the list can go on! Make friends with locals.

3. Accept that this project will take about three times more time than you planned for. On reflection, that might just be me: I'm not that skilled!

Re. the earlier post about 'by small you mean simple'. I couldn't agree more! Personally, I'd avoid building the all-singing, all dancing radio some of the books advocate unless you or one of the locals you're now very friendly with has experience of debugging such a beast. For me, half the fun is building, so I'm already poking about for a suitable something for when the current VHF SSB set is finished!

Good luck & I hope you find a suitable diagram / kit / idea to work on. I look forward to hearing you on the air with it - there's nothing better than that first QSO with a homebrew!

Regards,
Dave

Anyone who wants to comment on the essential tools for beginners, would you mind starting a new post please? It will help keep this one on-topic.

Thanks & see you all on-air.

Rob
My long term goal is to design a backback portable HF SSB/data rig to compete with the current offerings (SG2020) and Elecraft. I will probably never get there! I think with some new ideas and SM technology I could get the current drain << 100mA on receive and keep the size V small, while having digital programmability etc
BTW I would be interested in formiong a cooperative group on this if anyone is interested.

Further to this
I thought I would use a Palm Pilot as the mechanism for entering data/E
mails and maybe even CW
You could have an infrared port as the connection between them
Has anyone done this?

Richard,

How 'bout this one?

5 VDC LATCHING RELAY, DPDT
Nais # DS2Y-SL2-DC5V. Nominal 5vdc, 139 ohm 2 coil latching relay. DPDT
contacts rated 2 amps (switching), 3 amps (carry). Small sealed case.
0.787" x 0.39" x 0.366" high. Fits 16 pin IC socket DIP pattern. UL,
CSA.
CAT# LRLY-155 Your Price: $1.50 each

($1.25 >25qty - They must have plenty)

http://www.allelectronics.com/cgi-bin/category.cgi?category=500
&item=LRLY-155&type=store

No vested intrest, just a customer...

73, Woody

Chris,

I have a couple of HC-6 package 3.559858 crystals with wire leads instead
of pins. That's 141 Hz below your frequency of interest. I believe these
are parallel-mode, calibrated at 32 pF capacitance. These came from Fair
Radio Sales of Nebraska. Send me your postal address & I'll mail you one.

You don't need to be a lawyer to know the law, nor a weatherman to know which way the wind blows.

You will be interfering with an authorized radio service. That's illegal.

You will be transmitting (outside Part 15 limits) without a license. That's illegal.

You will be putting on the air transmitting equipment that is neither inspected-and-accepted nor type-accepted. That's illegal.

You do not own nor control the airwaves on your property. I could try to list the things that are illegal even though you own the property they're done on, except that I have a 10-Meg limit on my temporary file size.

I agree you probably won't get caught, but don't kid yourself about what you're doing...

had the circuit diagram 30 years ago to compare whether the
differences between Sommerkamp FL-200 and FL-500 transmitters were
improvements or not, but it has vanished long time ago. Studied it and
found it was not too much differences from my FL-dx-500 of early
version, so if you could find this circuit it should be be good help,
but believe the version I sent to K4XL (BaMa) might be the newer
version, and the copies are no more here. I donated FL-dx-500 to a
friend in 1980, and the mechanical filter was replaced with a KVG XF9A
9MHz xtal filter which improved the spruious responses tremendous

Richard,

I believe the K2 is what you should be aiming to compete with. It
evidently is fairly good for the money.

I'm in Melbourne and would be happy to help in any way I can, time
allowing.

All the best,

Rob

This one is tried and proven to be a winner. Start with some kind of mild spark generator (large buzzer or mechanical bell). Isolate the device from it's power source with a pair of chokes (and place in soundproof box). Feed from the device(one lead to each side of spark gap or points) VIA 450Ohm open ladder line to a dipole cut to the 11 Meter band and orient it in the direction of the CB'ers antenna. This setup TRASHES AM and SSB RCVRS!!! I'ts possible your neighbors might see some sparklies in their picture on the low VHF channels. Want to make it REAL efficiant? take the CB radio you have and put a COR on it's RCVR. Set it up without an antenna to his favorite channel.When the COR closes it starts a time relay and transmits for about 10 minutes. Each time it hears the jerk it pops up and jams his RCVR. This scheme will NOT work over 500 feet. If this guy lives next door or behind you he IS game. He can not talk with someone ifhe can HEAR them to begin with. Even the dumbest of animals will soon learn....Eddie

From: Tom Holden <holden_family@sympatico.ca>
Message-ID: <n609b.106$mv6.24564@news20.bellglobal.com>
Source record: 32564
Cross-posted to:
rec.radio.shortwave,alt.radio.scanner,alt.radio.scanner.uk,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Welcome to the RADIOSHACKDX394 group!
http://groups.yahoo.com/group/RADIOSHACKDX394/

Here you will find a community of users of this dandy little tabletop LW/MW/SW receiver/scanner. Some members are keen short wave listeners; others are into AM DXing and a few enjoy long wave. Many experiment with antennas and some are ardent modifiers - customising and souping up the rig as hot rodders would do with cars. You'll find lots to interest you and help get the most out of your radio.

The group would like to hear from you. Send a message to introduce yourself. Tell us what you like to do with your DX-394 and what you would like to find in the group. It's as simple as sending an e-mail to RADIOSHACKDX394@yahoogroups.com. A suggested subject is "Newbie from (your location)".

If you have subscribed by e-mail, please proceed to register on the website so that you can enjoy all the resources available there, only to registered Yahoo members who have joined the group. You'll need to associate the e-mail address from which you sent the subscription request with your new Yahoo ID. As a registered member you can control the frequency that group messages are sent to your e-mail account - individually, daily digest, Special Notices only, or never.

Here's what's currently available, just a few mouse clicks away:

Message Archive: over 1446 messages as of Aug. 23/03. Use the search tool to find content of interest to you. Post messages right on the website or by e-mail.

Links: probably the most complete collection of links to other web sites and resources having something to do with the DX-394. Each one is described so you can speedily pick the most relevant ones. Try out the Google Search link for checking the latest on Usenet groups about the DX-394.

Files: certainly the most complete and comprehensive collection of modifications, explanations, and tips for this radio - all the 'famous' Frank Cathell mods from Usenet group rec.radio.shortwave are here along with recent ones by Tom Holden and others - and it continues to grow. Members are actively developing computer control, external Digital Signal Processing interfaced at 455 kHz, 455kHz/12kHz downconverter for interfacing to sound card for PC-based DSP, and simpler ones such as 1/4" phone jack, SSB Clarifier, etc. Look here for a comprehensive index with over 50 entries: Mods List. Have you got a mod to offer?

Photos: a growing collection of photos of modified rigs and of DX-394 shacks. Upload a photo of your set-up - no matter how simple or messy, with you or your cat in the picture, too!

Database: See the Survey of members. In one convenient spot, read what others are using their DX-394 for, what antennas and accessories they have, mods they have done or plan to do, what they like/dislike about the receiver. Take a couple of minutes and contribute your input to the survey - in fact, do that first and let us know you have done so in your first posting!

Members: over 450 as at Aug 23/03! You can browse the list and maybe find someone in the same city; it's possible to send a message to a member privately via the group's message server, even though you cannot see the member's full address.

Polls, Chat, Calendar: these resources are not regularly active. Maybe you have a suggestion and would like to initiate something.

Etiquette
Group membership is subject to approval by a Moderator to control spam-bots. Messages, however, are immediately reflected without Moderator approval. We want to keep it that way as long as the postings are on-topic, spam-free, use language and express opinions that we would be happy for our children to hear. a friend made a jammer for a difficult person who caused a lot of
problems for the surrounding world. The jammer had photodiode, and
would only operate when dark, it transmitted only after a CB
transmission - for the next 20 minutes causing reception impossible
for this guy, and it was hidden in a nearby trea

So this bloke couldn't make 2-way communication and after some time
resigned to find a new house somewhere far away from this place

He had caused very much problems running high power and blocking
TV-and broadcast-reception, so it was a good idea to keep him from
activitating the CB or what ever band

It happened many years ago, but still it is told to amuse the friends

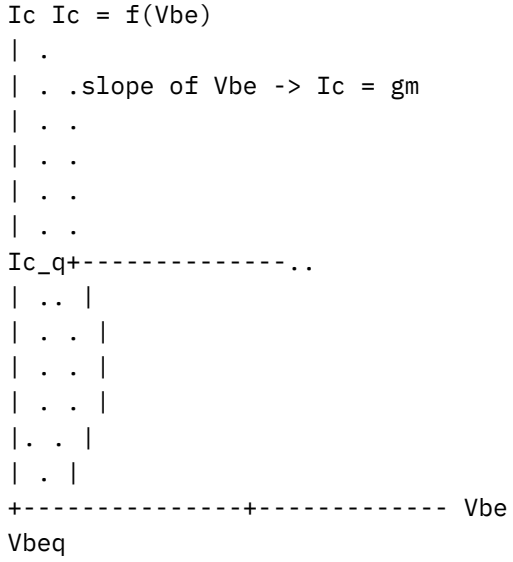
You are correct about the specific device (BJTs) biased class-A for multipliers such as the gilbert cell. They need to have the gm "slope" change for the gain to change, and changing the gain is what the modulation is all about. By definition that means those "slopes" are tangent to something that can't be straight (the Vbe -> Ic function). I was wrong about the specific device used in this type of application. The system in this application (DSB-AM) is most certainly linear (all phase and amplitude information is completely preserved -- the definition of linearity -- albeit at a translated frequency), but the Vbe -> Ic function for the transistor isn't linear and it can't be for it to work in the given configuration.

ï¿½ Gain is a direct function of gm.
ï¿½ Gain must change for amplitude modulation to occur, by definition.
.ï¿½. not only must gm move along the curve, the curve has to be a curve (not straight), otherwise the gain would not change.



Pretty simple really. No wonder I was so bored and fell asleep in EDSN101.

1902. What motors do you use to turn potentiometers and air variable capacitors?

Rob

A quick search of the revealed not much apart from the two mentioned. I have not used either but on paper at least, the 2020 appeared the most attractive. Elecraft kindly published their tuner design, which is simply a series of capacitors and inductors in a L network configuration switched by relays. They use a conventional SWR bridge to measure the match, with the whole thing controlled by a micro. Is that how you are planning to do yours? I have done a few successful projects using AVRs to control RF devices (see http://members.iinet.net.au/~richardh/VK6BRO.htm) so I reckon I could do the board design.
The code would take a bit of work - I am not sure what algorithm would be used
Do you have any ideas on this?

Richard

Hi Jason,
a modeller's servo seems to be fine: it has a high torque and while powered, it keeps its position actively. Disadvantages are their price and the fact they are controlled by AF PWM / PPM (unless one modifies them, of course).
A cheap source are scrap FDDs and CD-ROMs: there are 2 - 3 classic and stepper motors in each of these animals. They are used for positioning the head, rotating the media, ejecting the CD etc. It needs a bit of skill and effort to put them into new life, though.

The latching relays are fairly obvious, actually.

For the dual coil ones, you apply current to one coil to open, to the other coil to close. The single coil ones generally have you reverse polarity on the coil to change state. If they are latching relays, in both cases they won't change state with no current applied.

..

The military has historically used small DC gear motors, Pittman,
Globe, etc. Fair Radio has these at reasonable prices. The control
mechanism is all analog, classical servomechanism and error detector
and amplifier approach.

Alpha uses stepper motors to turn the tuning and loading caps in the
auto tune amplifier. These are fair size steppers with gearing.

If your control mechanism is analog, look at DC motors. If you are
going to use digital control, think steppers.

Harke,

I had the same thing happen to an 8640a. The failure was the output gold IC.
I found one for about $150 bucks. The failure happened when I had some
low voltage ac get back into the output, and I happened to have the attenuator
in the max out (no attenuation) setting.

As a note to anyone who has an 8640a or b, there is a reverse power option
that might save the power amp. I found the best preventative is to use a 20db
external N connector pad connected right at the output. Just divide the output
voltage level by 10 (20 db). eg, if you have .75 volt output, you actually
have .075 volt output from the 20 db pad.

What "mixing products"? The signal into the driver should be fairly
clean of unwanteds - if it isn't, that's a problem to be fixed in the
exciter.

I'd personally use interstage impedance matching with just a low-pass
which is often inherent in the matching circuit.

Here is an interesting idea. A guy could use a 555 timer chip to make a circuit that would literally key up in the guys face every time he keyed his rig, by connecting the trigger input on the timer chip to the signal from the s-meter , which is filtered dc. the amount of time it would key up for could be set by the timing interval of the chip . Now, we simply turn the sensitivity of the receiver down, and turn the power output down also on transmit. this means a 12- volt car battery could run this setup for a loooong time. The receive sensitivity is turned down until only strong local signals produce enough s-meter output to trigger the chip into keying the rig up. This ensures that it only keys on him, since you will place this somewhere near his residence.
A friend of mine did this with great success, since he took a regular breaker box, and mounted it on a light pole near the guy's house, along with a bunch of other boxes that were on the pole already, and ran a 9-foot wire up the pole. It was quite a while before the power company discovered the 'superfluous" box on the back of the light pole, long after it had served its purpose well. the 12- volt car battery that ran it lasted over a month with this setup..... total cost ? it might have cost two or three dollars to make the circuit on a piece of perfboard...

DUAL 10K LINEAR TAPER MOTORIZED POT CAT# MPOT-10K
http://www.allelectronics.com/cgi-bin/category.cgi

4 dollars.

Also, I've used surplus 1 rpm motors to drive capacitors.
You want DC, small and slow.

the last time i had to do this, i used a saber saw with a hacksaw blade in it. I clamped the metal between two pieces of scrap3/8 in plywood, then clamped this to the edge of the bench, and sawed thru wood, metal, and all at the same time. The wood prevents the metal from vibrating, and it just cuts like a regular wood strip would. This works equally well on sheet aluminum or steel sheet. You can even cut shapes out quite efficiently.

You mean something like a set of FRS radios? Or CB walkie talkies (or regular mobile CBs)? Oh, wait, I think I just got what you mean...you want to transmit so that the other person can hear you over the car radio? There are several commercial made "wireless microphones" that will transmit to broadcast FM receivers, available at Radio Shack no doubt...(I'd still opt for the FRS radios)

You have a number of options.

(1) FRS radios. Small, cheap, easily strong enough to go at least a half-mile, no license required. Obtainable at most electronic and office-supply stores.

(2) You and your wife could get amateur radio licenses, and use 2m or 70cm rigs on a simplex channel. You can switch to a repeater if you get separated. Requires study, a license exam, etc. You are also restricted from passing commercial messages ("Buy product X at store Y," etc.) by Part 97 regs.

(3) Get a pair of MURS radios. More powerful than FRS, same no-license-required, can go a little further, but considerably more expensive than FRS units.

Good hunting.

Get two wireless microphones set to two different frequencies and you will have full duplex capabilities. This way, she'll be able to interrupt you whenever she wants ;-)

Yes, that is what I was thinking. The legal LPFM, which does transmit
on conventional FM broadcast frequencies, has a tiny power output and
a maximum range of something like 1/4 mile, which is 15 seconds apart
at highway speeds. They make much more sense around your home, and out
into the yard. You would also have to retune as you travel, to work
around broadcast stations.

I think that FRS or CB would make much more sense, work better ,and be
easier to use.

Happy trails,

not much info there, but i've read articles about russian experiments on
small antennae and something about a capacitive antenna.

somewhere in the jumble, i came across a theory/claim supposedly
originated by Nikolai Tesla. the theory being that applying a large
voltage - low freq. ac, dc... i don't remember - to a short antenna
would set up an electrically large antenna by virtue of the electric
field.

say you applied 1000V to a 1m whip. that's 1000V/m. or it's 1V/m over a
length of 1000m effective antenna length. that's the theory... key word
"theory".

brs,
mike

Saturating the air becomes a problem. Coronas will sap away the power
and slowly incinerate the antenna with ozone.

1936. ** FLEA at MIT ** Sunday September 21st Cambridge MA

This coming Sunday....

+++ Now even more Buyers Parking !!!
Thanks to TKT we have use of their new parking lot
across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday September 21st 2003
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

You're misusing the word "theory." You mean hypothesis. I know, I know,
I'm nitpicking. But I once was chewed out by a physicist at MIT for
misusing the word when I was temping there. Ouch.

Al

PS:

theory - a proven fact which explains an aspect of nature; i.e., the
Theory of Relativity.

hypotheses - A tentative explanation that accounts for a set of facts
and must be proven by further experimentation.

An antenna has radiation resistance. If you deliver power into Rr, it,
well, radiates it. As an antenna gets smaller, its radiation
resistance increases, so to dump X watts into space using a smaller
antenna, you need to drive it from a higher voltage. P = E^2/Rr. One
gadget used to increase the voltage is an "antenna tuner", just a
resonant matching network. There are practical limits on how much
power you can force into a small antenna: skin effect heating,
ionization, matching network Q, stuff like that. Nothing mysterious
here.

I especically like the statement:
"Our tiny antenna can be placed in the car or cast in metal, and is at least
as good"

Great, an antenna working even if cast in metal....

Arie.

Time will tell.

It's likely we'll not find out the exact details (if it lives upto ad-bumk that is) but what else can it but a coil wound round a lump of ferrite ?

I don;t personally see why a ferrite can be used for transmitting - but then I'd need filling in as to what the technical reasons are for this supposed reasoning is.

Howdy Radio Afficionados!

Here it is again, if you missed it last year, here is your chance to have radio and beer/polka fun at Montville, NJ Oktoberfest!

There will be special Ham tables or you can book your exclusive. The price is paltry $25 per person, no need for donations, bribes or taxes. Unbelievable fun fueled by original, direct from Schwartzwald - Spaten Oktoberfest Bier on tap, all you can drink! You can also bring your favorite booze, setups - glasses will be provided, no need to hide it. Don't miss it, make your reservations now before we run out of tables.

Easy to get to: from Hwy 80 take 287 north, to exit 47 for 202 east, about 1/4 mile make right at traffic light by Exxon onto Changebridge Rd., St. Pius X Church and center is about 1/2 mile on the left, plenty of parking. No need to travel to Germany, it is right here in your backyard. Excellent opportunity to meet by good beer, tell the lies and have fun with your brothers and sisters hams.

Directions and poster are at www.K3BU.US

See you all there!

Oktoberfest Oberchairman
Yuri Blanarovich, K3BU

Montville Oktoberfest Dinner - Dance

Saturday, October 11, 2003 7 - 11 p.m.

Dinner includes:
Main course:
Sauerbraten mit gravy, Bratwurst,
Spaetzel, Red Cabbage

Desert:
Applestrudel, Coffee, Soft drinks

Main attraction:
Spaten Oktoberfest Beer on tap

For dancing and listening pleasure:
DJ music by popular European bands

by Knights of Columbus
at Msgr. Meyer Parish Center
St. Pius X RC Church
24 Changebridge Rd., Montville, NJ 07045

Admission $25/person, dinner and drinks included, BYOB setups

Reservations required by 10/4, tables for groups of 8 - 12 available

Call Yuri Blanarovich, tel. 973 808-1981, Email K3BU@aol.com
or mail your reservations by Oct. 4th with checks made to
St. Pius X KoC,
Box 282, Pine Brook, NJ 07058

Bring your friends and have a great time!

Ein prosit!

To go another step or another way, it also allows YOU the operator to call in "yourself" for food, restaurant, motel, tow truck. So long as YOU the operator are not making the "monetary" profit from the transmissions. The above example was correct, but it implied somewhat 3rd party calls to a profit making venture As for the example you telling some one else to buy product x at store y, so long as you have no viable pecuniary interest in Store "y", you can refer anyone to that store. That would be no different than say directing a stranger in town via 2 meters where to buy the goods they need to enjoy their stay. The way it USED to be, you couldn't even call for a tow truck! Advertising? I can't advertise my own radio repair shop, but someone else could mention me, to anyone asking or in general discussion.

Well, actually, no. The radiation resistance generally decreases as an antenna gets smaller, assuming it's small compared to a wavelength.

At any given frequency, you can analyze the impedance of a small
antanna as a series R-C or a shunt R-C. Viewed as a shunt resistance,
Rr increases as the antenna gets smaller, and as a series network, it
gets smaller.

I guess the standard convention must be to treat Rr as a series
element, so it gets smaller as the antenna gets smaller.

Either way, it takes more volts (or, if you prefer, more amps) to
force a small antenna to radiate as much as a larger one.

Yes, "resistance" is traditionally used to mean the real part of an impedance, which in turn is expressed as a complex number. An equivalent circuit for an impedance is then a series R - X, with the R and X corresponding to the real and imaginary parts of the impedance respectively. Parallel equivalents are of course also used, but usually explicitly described as a parallel equivalent, or given as a complex admittance (G + jB, with G and B representing the shunt conductance and susceptance).

As an antenna gets smaller, the impedance does rise, causing a requirement for more voltage for a given power. The rise, however, is due to increasing (series) reactance, not radiation resistance. If you make the antenna long enough to reach resonance, then continue making it longer, the impedance again rises until you hit "anti-resonance" (parallel resonance). In that region it's due to both an increasing reactance and an increasing radiation resistance.

A real consequence of the low radiation resistance of a small antenna is that the conductor current is very high for a given applied power. This results in increased I^2 * R loss in the conductors. The loss can be very substantial in small antennas.

Art Bell Returns to Radio
as Weekend Host of Coast to Coast AM

Press Release www.coasttocoastam.com

LOS ANGELES, Sept. 17, 2003- Art Bell, the radio personality known for his spontaneous and compelling conversations about all things unexplained, will replace Barbara Simpson as weekend host of Coast to Coast AM - the program he made famous. He will broadcast live from 1-5 a.m. ET Saturdays and Sundays with a refeed from 5-9 a.m. ET from his home studio in Pahrump, Nev., beginning Sept. 20.

Bell stated, "For me, a return to radio is both mysterious and reassuring."

"We welcome Art back to the weekend microphone," said Kraig Kitchin - president/COO Premiere Radio Networks. "His return reflects his long-standing bond with this audience and his undying passion for radio."

1961. Antenna/Network Analyzer

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-18 11:41:23 UTC
From: W3JDR <joe@roccis.com>
Message-ID: <DRgab.3705$U6.2132@nwrdny03.gnilink.net>
Source record: 32628

Has anyone here built a GOOD antenna/network analyzer?

From what I can determine, the MFJ stuff doesn't resolve the sign of reactances, nor does it have a computer interface. I was looking at Analog Devices' AD8302 IC (http://www.analog.com) for this application. This is a single-chip device that measures the gain and phase difference between 2 RF inputs up to 2.7 GHZ with very high accuracy. It occurred to me that this chip, together with a PIC that has A-D conversion, and a computer-controlled station transceiver, could form the basis for a very nice programmable antenna/network analyzer that would run rings around the MFJ units.

Comments?

Hi Joe,
Look at:
http://www.njqrp.org/antanal/
Perhaps your IC could be combined with this controller.

The technology has been available for several years to enable a manufacturer to produce a reasonably priced, small, hand-held, battery-operated, antenna analyser which displays the sign of jX.

But the manufacturers have not yet extracted all that's available from the market. Its too early to introduce a new model which would outclass the old.

What is needed in the market is a new manufacturer who has no history to take advantage of.

Chinese ?

Dale,
Actually, I was thinking that the controller is a PC or laptop. It would control the station transciever as a swept low-power frequency source, and get the phase and gain readings from the PIC that would be paired with the Analog Devices part (and of course a directional coupler of some sort...even a simple bridge would suffice). This design could result in a very simple, low-cost, and powerful vector network analyzer for the average ham.

Reg,
I don't think it has much to do with planned product lifecycle...it's just inertia and complacency. Nor do I don't think there's enough volume for a "Chinese" manufacturer.

I think the main reason we haven't seen something better is that it's too small a market for a startup to tackle. It's definitely a product for a tiny company.

Source record: 32634

The chip you're looking at does have a 180 degree ambiguity unresolved. Makes it tough to do the job you're asking of it. Wait a couple weeks and look on Google for N2PK. You'll find a real vector network analyzer good from 50 KHz to 60 MHz with narrow band application to 2 meters and 432 MHz.

Message-ID: <f03bf94f.0309180721.7c8f96ce@posting.google.com>
Source record: 32635

Hello to all,

I have looked with interest at the new Ten-Tec Vee Beam Terminated antenna. Is there a guru on the list who has the knowlege to share on how to duplicate this antenna?

It is a vee beam with each leg terminated to ground with a resistor, and there is a balun of sorts at the input.

I remember an antenna similar to this years ago, and I think ten-tec will have a winner with this if folks can get away from the supposed "horror" of a terminated antenna.

Details at www.tentec.com

I wish I could afford it at this time!!

Regards, Howard

It's just a half-rhombic, but must suffer seriously from the poor grounding that the ground rods provide. That will both reduce the front-to-back ratio and make the input impedance vary (much) more with frequency.

A real unidirectional rhombic has the single terminating resistor directly between the two sides, and needs no ground.

Does this terminated V have about the same gain as a rhombic the same length? I suspect so. The rhombic would require four tall supports - a clear disadvantage.

Rhombics were used at VHF years ago. The 1950s NBS (now NOAA) Cedar Rapids (IA) to Sterling (VA) and Longbranch (IL) to Boulder (CO) scatter links on 49.8 MHz (or nearby) used 600 foot long rhombics. Really strong Es allowed lighting a small lamp directly from the receiving antenna - the transmitter ran 20 kW, IIRC.

Harold,

The chip's phase measurement transer function has a positive slope for phase angles less than 0deg and a negative slope for phase angles greater than 0deg. So it seems to me that resolving the 180 deg ambiguity is just a matter of knowing which slope you're on. This might be done by switching in a small known reactive component and observing which direction the phase output changes. Once you know which slope you're on, I think you're home free...no??

1971. signal to noise ratio drops on connecting the antenna

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-18 15:51:13 UTC
From: farhan@hotfoon.com
Message-ID: <8331b126.0309180751.65c407e1@posting.google.com>
Source record: 32637

i am in the process of homebrewing a 7/14 mhz transciever. i am in india, we dont get toroids easily.i tried an double diode mixer built using tv baluns double barrels, but they were lossy (about 15db loss) and the third harmonic of the vfo created so many birdies that i couldnt tune anything beyond 14200. (the if is 10mhz and the vfo goes 4 t 4.4mhz on 14mhz operations). so, i switched over to a single FET mixer.

i measured Idss as 6ma, pinch-off at 2.4volts on the BFW11 that i have in the junkbox. i baised the BFW11 for 1.2 volts, 3 ma current. the input to the BFW11 is a double tuned band pass that i tune up for max signal. (a 14.318mhz computer crystal in a battery operated oscillator is my weak source). the antenna coupling is via a 2:15 link over the first coil of the bandpass. it has excellent signal handling and pretty low noise levels.

i have wired up a 300 ohms folded dipole using tv twin flex. i connect the 300 ohms line directly to the receiver (the two turn link over the first coild of the DTC bandpass filter). the antenna is about 6 feet off the terrace in a gangly inverted V.

i have noticed a strange behaviour. if i connect just one lead of the antenna to receiver input (leaving the grounding unconnected), i get pretty good signals. when i connect the ground input too (to the other end of the 300 ohm twin lead), then the noise and the signal goes up by 2-3 S points. however, the noise increase is nearly 10 db over and above the signal increase. esp., the shot noise. the weaker DX signals are nearly lost if both the leads are connected.

to resolve this problem, i have tried the following:
1) i inserted a 470 ohms pot in the antenna input, and tried attenuating the signal, the signal and noise go up and down proportionately. the increase in noise is the same at all attenuation levels as long as the attentuation keeps the atmospheric noise above the receiver noise level. so, attenuation is does not make the noise go away.
2) i tried putting a variable broadcast capacitor of 365 pf in series between the hot end of the first coil of the DTC and the hot end of the antenna and tuned it across the range. NO change, the signals and the noise increase and decrease proportionately upto 50 pf and no further change after that.
3) i tried detuning the FET drain tank. NO change. it behaved the same as above two. the signal and noise levels change together.

these days, we do have very high atmospheric noise on 14mhz in south india. but i guess that in anycase, connecting the antenna tigher

should increase the signal to noise ratio, not decrease it.

any ideas?

All the analyzers I have considered have always been to inaccurate. They sure may work on the DC bands below 30MHz where people think an antenna is good if the SWR is below 3.

This IC seem promising. Together with a small MCU and AD and some flash memory you might be able to build a really good instrument that could beat everything on the market.

Does anyone know a source for these chipts whithin the EU? I have some directional couplers without detectors that could easily be combined with this chip.

Your Idea to use a PC to control the radio as a source seem interesting. The only drawback would be the size of all the stuff you need to bring into the garden when measuring.

Perhaps a modular design.
a) Optional RF-circuit (directional couplers) different for different bands to increase accuracy.
b) Detector device (AD-chip, small controller with calibration data)
c) Optional display for computerless operation
d) Optional signal source for rig-less operation.

/Leif

Leif,

>>Does anyone know a source for these chipts whithin the EU?<<
I believe you can purchase them from the Analog Devices Web site. Don't know if that works outside the US though.

>>I have some directional couplers without detectors that could easily be combined with this chip.<<
Do you really need a directional coupler? How about just driving the load through a known resistor
and measuring the voltage & phase shift across the unknown?

>>Your idea to use a PC to control the radio as a source seem interesting. The only drawback would be the size
>>of all the stuff you need to bring into the garden when measuring.<<

I suggested the station rig as a source because it already has a programmable frequency generator for any frequency the ham is likely to need to measure...why reinvent it? On the other hand, it's easy these days to build a DDS frequency source that works into the VHF range. Used laptop PC's are plentiful and cheap, and have great computational and display facilities. I was thinking of a small module that works with the station PC or a laptop.

You can do this with an MFJ or any other analyzer to resolve the sign ambiguity
of X. Switch in small known reactance, see which way X goes. Also, hooking a
computer interface to an MFJ would probably not be that much more difficult
than interfacing with the AD chip. So, no I don't think this would run rings
around an MFJ. However, if you do go this route, I would be very interested in
how it turns out.

>

Who knows what he meant by that, but the idea of using a "line
stretching" hack to resolve the phase ambiguity sounds like a great one
to me. I'd definitely be up for building a VNA that has decent
frequency coverage and that's PC-driven. I'll take a gander at the
AD8302's specs first chance I get and see how it looks!

1985. LONG OT FCC BIG HIPPO

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-18 22:56:07 UTC
From: tk <gamach1@ispwest.com>
Message-ID: <3F6A3807.F9C16F5D@ispwest.com>
Source record: 32402

Wednesday's Atlanta Constitution had a front page article on the vote in Congress to block the latest FCC decree on media ownership. The thing that caught my eye was King Powell's statement "I hope that Congress will take a more considered view of the PUBLIC interest." What a hypocrite...
(had to look it up !!) Does anyone on this newgroup ever remember the "public interest" being a factor in an FCC ruling ???? They don't know the meaning of nor do they acknowledge the existence of PICON in their mission statement.

I get a monthly reminder in my Telco bill of their public interest. 30% of my monthly bill has absolutely npthing to do with local phone service...

Cheers

Ted in Atlanta

Running a model with an apex angle of 90ï¿½ as per the illustration on
page one of their Installation and Operation manual. NEC reports the
following maximum forward gain:

Using 50 foot arms

Freq. MHz Gain dBi Elevation Angle

3.5 -13.8 80ï¿½
7.0 -5.3 55ï¿½
14 -1.8 33ï¿½
21 5.63 23ï¿½
28 6.51 47ï¿½

Using 100 foot arms

3.5 -9.4 64ï¿½
7.0 -1.06 47ï¿½
14 4.51 25ï¿½
21 4.35 17ï¿½
28 3.24 57ï¿½

I'm just brushing you off. I wrote to let you know of another avenue to do the job you wish to do where someone else has invested a tremendous amount of professional work in both the hardware and software. It will be available on the Internet in a week or so. (Several of us have enjoyed the end product as a Beta test group for something over a year.) I don't have any time or interest in participating in a sincere dialog.

Hi Harold,
I well recall Paul's wattmeter- well (or even way) beyond what others had done- the engineering and documentation was superb. Looking forward to his work on the VNR.
I am not far from you- near Cashiers on Lake Glenville.

Pins 1 and 5.

> Also I know it is a 5 volt tube
> and 14.5 amp.do I really need that much to make it glow?

Yes, you do.

> Would 12 volt work?

For a very, very limited time, providing your 12V supply is capable of
dishing out 40A. If it's not, it would either clamp down to the maximum
current or trip the breaker.

If all you want to do is make it appear that it's glowing, build in a
few LEDs into the wood base. None will be the wiser.

You sure don't want to put 12 volts on it unless you want to burn out the filament. It needs 5 volts. The transformer will have to supply the 14.5 amps or it will not hold up, either. There are 5 volt transformers out there which have no center tap that can be bought pretty cheap since they won't work out easily for use in an amplfier..

isn't that going to get it hot enough in time to crack the seals? had
some guys working up a linear in 1971 at NDSU that just had the
filaments on a pair of 4-400s without the fan on, and killed 'em with an
ugly, loud cracking noise.

orange LEDs would be more authentic, I think, than red ones to make a
glow in the firebottle.

Hi Dale, I had no idea that you were that close. Been to Glenville many times. Why don't you come over on the first Wednesday of any month for our QCWA lunch. We have a very active group and actually have two meetings a month, but the first one always has an interesting program. If it poses a problem doing it in one day, We have a great guest apartment and I'd put you up for a Tuesday night sort of thing. You can even play with my STAR. A little DSP transceiver
that Peter Rhodes developed. 160-10 with superb characteristics. There are 9 of those finished now, with another half dozen in various stages of completion just in the Beta group. I have no idea how many more are being built
as the project continues to evolve in Radio Communications.

If you liked Paul's wattmeter, you'll be blown away with what he's done with the VNA. Documentation itself is in 3 parts and looks like a doctoral dissertation.

Both Paul and Bill Carver were here last month (Wish I had known you were this close! We met Alan Victor and Jim Scarlett and his son at Shelby for lunch) and brought their VNA's along
for a round robin test. Under 1 percent variations on the Q of a test crystal between the units. He's added software to make it perform a half dozen other tasks, Transmission, Reflection, Group delay and some real time stuff. I've junked my dual crystal oscillators in the quad
shield for Ip3 tests, the VNA does it on ANY frequency. A real "Lab in a Box". I think I've run the antenna characteristics on everybody's antennas within a
10 mile radius.

Hi, all concerned:

Everybody wants to do it in software ;o)

Telescoping brass tubes from hobby sources, or telescoping aluminum tubes from eg Texas Towers, can be used to build physical line-stretchers. Put the movable parts in a trough say of copper or aluminum gutter for unbalanced apps. Plan the device parts carefully, and near-50-ohm surge impedance can be had by purists and others.

That's certainly possible, although it will cool better convectionally out in the open than inside an amp enclosure. It surely would get pretty hot, about as hot as a 75 watt light bulb in use would. You wouldn't want to touch it at that temperature

> orange LEDs would be more authentic, I think, than red ones to make a

That's probably the best way to go, eliminates all the current and thus the heat. But nothing will show up like the original filament glow.

Harold, I think you're "misunderestimating" both the degree of sarcasm
behind my post and my degree of control over the newsgroup's content. I
was merely suggesting that it makes no sense to deride an honest inquiry
about a chip and its applications on a homebrew newsgroup. After all,
you can buy any number of radios and kits, most of which will outperform
and out-feature anything any of us are likely to build, but that
doesn't mean you should tell someone who asks about designing a receiver
to STFU and go buy a 95S-1.

If you're seeing a lot of spam on the newsgroup, you may want to look
into a news provider that supports filtering on the server side. With
Giganews.com, I never see more than about 1% or so of the spam. I'm
afraid I'm unable to offer any further help with the Art Bell crap,
despite the power invested in me to redirect follow-ups to my own posts.
:)

I suggest applying a lower potential, say 4 Volts. That would make the glow a more orange color, maybe more impressive, without risk to the filament and a lower bulb temperature.

On the other hand, are you sure this tube is defective? Good tubes are worth around $100 and I'm sure you can find a shorted one for very little.

Due to the high current drawn by the filament, it's common for a poor socket contact to cause excessive heat at the tube pin, melting the solder and causing the filament to go out. There are many tubes out there that have been scrapped with the thought that the filament is burned out, when in fact the tubes are repairable. (I just repaired one for a fellow amateur.)

Very good point. I've done the same. Poor filament contact is fairly common
especially when used in older amps.

I believe you redirected my post without consideration as to what it
comprised.
My comments properly were directed to a poster who asked about an Analog
Devices chip that would not satisfactorily perform the task desired due to
an
inability to resolve an ambiguity at a single frequency. He then asked
about
using the phase slope of additional frequencies and I suggested doing it the
way he wished. I've already expended more "discussion" than I intended,
mainly
due to what I think is your "sarcasm". I didn't suggest buying anything .
Might
you be "misunderestimating" the results of your actions? If you have ANY
control over the newsgroups content, you might expend it more judiciously.

I for one will be blad to hear Coast To Coast broadcast regularly "from
the High Desert," even though it is on a part time basis. George Noorey
is an excellent replacement, but Art Bell invented the format.

I just hope his back will hold up for the abbreviated work schedule.

Does anybody know where I can get a Harris or Intersil
HD6100, HD6120, IM6100, or IM6120 microprocessor (cmos pdp-8)?

I used to work for Digital, and thought it would be an interresting project
to homebrew a PDP-8 system. I have a T11 microprocessor chip in the junbox
someplace, so a PDP-11 system is also a possibility.

I have seen 2n3866's on ebay a while ago. They do pop up from time to time.
Enter a search on your 'my ebay' page and have it set to email you when
something shows up. You might have to wait a month or two, but something
will turn up, if history is any example.

Thanks for the excellent description. It's not clear if the device works like a regular antenna - apparently it is encased in ferrite the size of a grapefruit. Here is the url again:

http://www.aftenposten.no/english/local/article.jhtml?articleID=609108

Now we all know ferrite antennas work great in AM radios, especially where a strong interfering signal can be nulled out. But it's not clear how well they work as transmitting antennas.

Wouldn't they have the same inefficiency problems as a small loop antenna? In other words, very low radiation resistance? If so, it doesn't seem possible it would have long range.

Perhaps it is meant for local communication over short distances, which can be useful for secure links. There is an interesting article on magnetic induction, where the field strength falls off as 1/r^6 instead of 1/r^2. This group talks about using very small antennas for distances up to 2 meters:

It's really hard to tell anything from a press release, and even harder to believe most of what you can tell from it. One thing that stands out is that the antenna being described is apparently operating at a pretty low frequency, where all antennas are very small in terms of wavelength, and very inefficient. Without any technical information, I can only offer some generalities.

A small antenna (in terms of wavelength) is going to be inefficient, and a tiny antenna is going to be very inefficient. And efficiency is important in a transmitting antenna. (I noted an exception to this in another posting about a terminated vee or rhombic antenna, but the exception doesn't apply here.) Often, for a given size small antenna, you can get lower loss by putting it on a ferrite core. But unless the chunk of ferrite is truly awesome in size or the frequency is pretty high, the antenna you're starting with will be tiny in terms of wavelength. That is, you might improve a very, very, very inefficient antenna to a very, very inefficient antenna. And that's probably the reason you don't usually see ferrite cores in transmitting antennas -- it's better to make them a bit bigger, too big to practically use a ferrite core.

Somebody mentioned saturation as a consideration. I'd have to work through the numbers with an actual core size and material, frequency, number of turns, and power level to see if it would be a problem. But the very large air gap in the magnetic path (from one end of the rod to the other -- which is, in fact, where the radiating field escapes) greatly reduces the flux density, so you could probably run a surprising amount of power without saturation. In many ferrites routinely used at RF, losses cause objectionable heating at flux densities well below saturation, and can often shatter the ferrite before saturation is even approached. Among amateurs, core heating seems to be almost universally blamed on saturation, due to a lack of understanding of the mechanism really causing the heating.

There are certainly many applications for small, inefficient transmitting antennas. Even a small improvement in efficiency is beneficial, and that might be what the folks in the article have accomplished.

Talk about bad timing ....

Just a couple of days ago two friends of mine hauled a PDP/8 out to the dump. Of course, you might not have been able to afford the power to run a REAL PDP/8.

I never actually worked with an 8, although I did publish a paper on 11M crash dump analysis. Might be fun to be able to grok a little Macro-11 from time to time ... hmmm ... wonder if there's a Pro350, or even an old 11/44, languishing in someone's basement.

The radiating and receiving efficiencies of ALL small ferrite- rod antennas is very, very small.

It's crudely about the same as a whip 10 times longer than the rod.

The rod has the advantage over the receiving whip because it can be fitted inside a medium-wave pocket transistor radio and contains its own tuner and matching transformer. In addition, the rod does not need a ground.

The MF receiving rod appears to behave very well only because MW broadcast stations are high power, relatively local, and pocket-transistor receivers have a higher gain than your shack transceiver which at MF is intended to be connected to a 260-feet length of wire at a height of 60 feet.

If efficiency of a small transmitting rod should be as high even as 1 percent, regardless of whether the loss is in the wire or in the ferrite, it is obvious 99 percent of the transmitter power will be dissipated in the antenna and only a 20-watt transmitter would wreck it.

PS: As with a magloop the ampere-turns are high but nearly all loss occurs in the ferrite. A serious problem is the high permeability temperature coefficient. As the core gets hot the antenna detunes itself.

If you MUST have a dinky 160m pocket transceiver then try a dust-iron antenna. Six rods round one rod or a number of stacked slabs will have fewer suicidal tendencies. By far the fastest way of finding the number of turns is to wind on some wire and if there are too many take some off again.

Reg, G4FGQ

2029. T/R switches

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-20 15:25:56 UTC
From: jason_hsu@my-deja.com
Message-ID: <f7d9a152.0309200725.5f9b9e1f@posting.google.com>
Source record: 32446

I'm looking for a passive T/R switch for a noise canceller project.
The idea is to BYPASS the noise canceller circuit AUTOMATICALLY and
IMMEDIATELY upon transmitting, even when the noise canceller is turned
off. This is VERY important, because transmitting power into the
noise canceller could fry some of its components.

Are there places to buy T/R switches? Or must I build one myself?

Jason:

How fast to you want it to operate? If you can tolerate a few mSec
(say 7 or 8 mSec after bounces cease) operate/release time, an
inexpensive Omron G2RL-24 relay will do quite nicely at the 100 watt
level.

I'm working with N8LP on an article characterizing those relays as RF
switching devices, and so far we are quite pleased with the measured
results.

And, of course, an advantage of a relay is that you can wire it so
that when the canceller is unpowered, the contacts switch the device
out of the circuit, so it meets your requirement.

If you can't tolerate the time to operate a relay, then a PIN diode
switch may be your answer. Not cheap and not necessarily easy, but
FAST. If you can accept a few mSec delay, but not 7 or 8 mSec, then
you can speed up a relay operate/release times, or try a faster relay,
such as some of the reed devices that operate in 1 mSec or
thereabouts.

If you are at QRP power levels, then ordinary signal diodes may work
in a diode switch. It may not meet your power-off requirement, though.
Of course, a combination relay for power-off protection and a diode
switch for normal activity could do it.

As far as buying a T/R switch, relays are certainly available
(Dow-Key, for example). Since almost everyone these days uses a
transceiver, the market for stand-alone T/R switches has greatly
diminished since the days of separate TX and RX.

Why don't you define your requirements a bit for us, such as:
(1) power to be switched

(2) speed for switch to operate/release
(3) power available to operate the switch
(4) cost target
(5) frequency range (assumed to be 3-30 MHz since you are working on a noise canceller)
(6) Isolation between TX and RX port
(7) Maximum acceptable loss

A friend sold a PDP/8 on Ebay for around $3000 US (and since he's in Canada, it will be even better for him), just in July. It did have some odd suffix (and some oddity about the hardware to go with it), so I'm not sure it that drove the price up.

It was his first "home computer", and while he got a good deal on it (I forget the story, but I believe he bought it surplus in the seventies). He was moving, so it seemed like a good time to clear it out.

Oddly, a couple of years ago I pointed him to someone periodically posting in buy and sell newsgroups looking for such computers. When my friend contacted him, the buyer was only willing to pay a few hundred dollars.

Sort of to get it back to amateur radio, most people know that Wayne Green started BYTE, and then later Kilobaud. But in the November 1972 issue of 73 (the thickest up to that time), there was an article about building your own computer, from logic gates etc. It was not a construction article, but gave quite a bit of detail on what was needed for such a time and place. Nobody ever seems to mention that article after the fact. I'm still trying to decide if the article had any bearing on how things went later. Did Wayne print it because he saw things going in that way, or did he just print it as filler, yet when small computers came along a few years alter, it helped to direct him to small comptuers?

These guys had this thing to the dump before I even heard about it. To tell the truth, I'm not so sure I would have wanted to deal with posting it on eBay, packaging, shipping the beast, all that, even if I had a chance.

> Sort of to get it back to amateur radio, most people know that Wayne Green

Reminds me of something really great from a few years back. I was the advisor for an electronics specialty Explorer post (basically older Boy Scouts). Anyway, we were donated a PDP/4. This was an 18 bit machine, interfaced to the printer and tape with a 6 bit transcode instead of ASCII.

Anyway, as we were first looking over the thing, with it's racks of cards and beautiful, huge electrolytics in the supply, my assistant advisor taps me on the shoulder and says "come look at this. See that rack of cards there? I think it's the accumulator."

Sure enough, 18 cards for the accumulator, 18 cards for the program counter, 18 cards for the M register, one card per bit!

..

Don't forget the ACS (Amateur Computer Society), which published a news-
letter from about the late 60's to the mid-70's or so (those dates are
from memory). I gave my copies to a computer museum years ago, but recall
it had construction articles, articles about members' computers, etc.

What are these parameters for the T/R switches in the MFJ-1025/1026
noise canceller and the T/R switches in the receiver circuits of
transceivers? The advertising for the MFJ noise canceller explicitly
says that it uses an RF sense T/R switch. I'm sure that transceivers
need T/R switches to prevent the RF from entering the receiver. That
can't possibly be good, because receivers are designed to be very
sensitive, NOT handle large amounts of power.

Since when did it become a "private" frequency? The H.F. Frequencies used for Ham operation are open to any one with the proper class of license to use them. Of course common courtesy does count when the frequency may already be in use. No wonder people are turning away from Ham. It is getting horrible. Used to be, I boasted it to anyone interested. Now, I tell them not to waste their time. It is getting to be High Power CB. As for the FCC, they have lost the battle so far as I'm concerned. The horses are out of the barn. TOO LATE! I'm about ready to sell all my ham gear.. Get my cash out of it while there is still some value left to it. I would NEVER buy a new rig again, that is for sure. I'll buy "used" if I decide to stay in it. It just isn't worth the huge cash lay out.

Somewhere I have packed away a Sym-1 an Elf II and a Intersil 6100
familiarization board that had something like 256 bytes of ram, a boot rom
and a uart (the uart is farkled either the data out or data in line is bad
which is why I packed it away). I only have 25 more years till retirement,
so I may find time then to pull them out then and see if they still work. As
it is now I can't even find time to work on my remaining cp/m machines
(Xerox 820IIHD, RS 4p, Balcones BNV205, Osborne 1, Osborne Exec, and
Kaypro4).
thanks, John.

I don't know if you would be interested, but there have to still be a few
Heath LSI 11 systems out there. That was the only home version of the 11
that I know of.
thanks, John.

In fact, there is a fellow who sells kits and parts for the SBC6120, which is a build-your-own PDP-8 based on the IM6120 chip:

http://www.sparetimegizmos.com/Hardware/SBC6120-2.htm

And this fellow has an add-on for the SBC6120:

http://www.jkearney.com/sbc6120/iob6120.htm

Also, IM6100 chips show up on eBay from time to time.

PDP-8 documentation may be found at Al Kossow's site:

http://www.spies.com/~aek/pdf/dec/pdp8/

And at Dave Gesswein's site:

http://www.pdp8.net

Also, Bob Supnik's SIMH retrocomputing simulator supports the PDP-8. SIMH is hosted at Tom Shoppa's Trailing Edge site, currently down due to the effects of Isabel:

http://simh.trailing-edge.com

To those of you who chuckle at the OP's questions, I've got a PDP-8/A sitting about 5ft to my right as I type this, and a another in the basement, right next to a PDP-8/E, a VT78 (based on the IM6100) and a DECmate II (based on the IM6120). Just today I was at one place with a third PDP-8/A which I refurbished a few months ago, a working PDP-8/E, a PDP-8/L in need of serious help, 3 PDP-12s (essentially PDP-8/Is with added A/D and D/A I/Os), several DECmates and a LINC-8. Today I also stopped by a place with a several more DECmates and a PDP-8/L that I and a cohort rescued from the defunct United Electronics tube factory in Newark, NJ this past spring. PDP-8 Disease is incurable. Once infected you're happily chronic for life.

You can do an awful lot on a computer with only 8 instructions that can directly address a mere 256 12-bit words at a time - if you're willing to think a little bit. PDP-8s are to computers what regens are to radios: Obsolete, but amazing for what they can do with so little, and a tremendous pile of fun to play with. In essence they're the spirit of QRP operation as applied to computers.

.....
Good thing old Rich Whiten is gone...THAT was a radio Hog times two....
The old YI YI song reminds me of Rich's selfish stupidity as he keyed over
all but a few of his chosen "butt buddies".
Rich would, in his arrogance, ignore all Hams who weren' t running
megawatts....of course old Rich got caught running over the legal
limit...among other things.
Story is that Rich got pissed and sent his resignation of his license to
Riley Hollingsworth. Riley accepted the resignation and rescinded Rich's
license.
Enter another story...Rich is now claiming that his letter of resignation
was sent "by mistake" to Hollingsworth and Whiten wants his license back.
Sorry, Rich. Your weak story ain't holding water up this way.
Gosh...how does one send email "by mistake"?
Rich is full of it...he screwed up out of anger and now he wants to take it
all back. It doesn't work that way.
Porkbutt Song.....YI, YI, YI.....

EGO was started by FHP engineers that declined to relocate, one of which was me. The projects only became competitive after FHP moved to North Carolina and expanded its objectives. The book is accurate on this point, and pretty much everything else.

It sounds like the stage might be oscillating at some very high frequency.
A specturm analyzer, lightly coupled to the output circuit would show that.
I know that it is not easy to get ahold of a spectrum analyzer most of the
time, but maybe you could do some research on neutralizing circuits. I
think that you have some sort of feedback path, maybe internal to the device
itself.

Jason:

A T/R relay in a transceiver has an easier job of it, because the
designer can sequence the operation, along the following lines:

Key Down -- Start TR Relay in motion -- wait a few mSec -- turn TX on
and start putting out power.

By sequencing the operation, you have two advantages (a) the relay
doesn't have to hot switch RF and (b) the relay doesn't have to be
blindingly fast, a few mSec is fine.

Your case is different -- you will have to sense the RF and hot switch
it. Still, a relay should do what you want.

I have a JPS noise canceller and it uses a simple relay. I suspect
something similar would work for you. I can recommend an Omron
G2RL-24 relay. You will be able to obtain at least 40 dB isolation up
to 50 MHz, and closer to 75 dB below 10 MHz. That's more than enough

to protect the front end. And, we have put well over 1x10^6 operations on one hot switching switching 100 watts RF without failure. In fact, I've got close to 100,000 operations switching 400 watts without a failure so far.

In the early/mid 60's the Science Club in my high school built a computer of sorts out of salvaged telephone relays -- more of a binary adder than anything else (sorry, I was too interested in 20 meters at the time!).

The Computer Museum is out in Mountain View California.

>....[snip]....

You can also do an awful lot on a computer with only 8 instructions that
can directly address only THIRTY-TWO NINE-bit words at a time:

In 1969, while at Fairchild R&D Lab in Palo Alto, CA, I designed and
built a 9-bit PDP-8 imitation (I called it "MINUS", since it was smaller
than a mini-computer; if I had called it "MICRO", I might now be rich!)
with 512 9-bit words of 200 nsec memory. Its instruction format used
a: 3 bit opcode,
1 bit current page/page zero indicator,
1 bit indirect indicator, and a
4 bit address

I also wrote a cross-assembler (in FORTRAN) for it, interfaced it to a
20Kbyte/second magnetic tape and a 3-foot x 5-foot flat bed plotter,
and wrote a program (in MINUSASM) which, in a tight loop, read mag-tape
printed-circuit wirelists produced on an IBM 360/44, buffered them in
the upper half of memory, and then passed them to the plotter to draw
large PC boards. Just before quiting time, we'd load a new mag tape,
and 5-6 hours later another board had been drawn in three colors
(horizontal, vertical, and vias).

Ah, those were the heady days of youth!

Hey group,

I build a PI network antenna tuner with 2 variable caps and an air
form coil. Is there a componant I can add to this device to reduce
noise from my random wire? I have heard a 1-1 transformer may help.

I have a few toroids with very high Al (79uH per hundred turns)
kicking around. Can I wind one of these to use a noise reducer?

any other suggestions to reduce noise?

can someone toss me a link to a howto?

thanks,

mike

Hello-
I have a small qty. of NOS EF Johnson S-meters from an old CB shop. I can furnish a JPEG on request, should have a few extra to sell. Can someone help me in using these meters : The pointer resides at full scale, rather than at the low scale as most meters. I guess you would say the meter is "backwards". How would you compensate for this in normal S-meter circuit?
Thanks, Byron, WA5THJ.

well, i found out that the antenna was the culprit. although i dont know why. i took the rig to a friend who had a two element yagi on his rooftop. he was using an FT-757. we pulled the antenna out of the Ft-757 and connected it to my rig. he put on the headphones and started to say "the rig is dead...." when he nearly spilled his coffee. as he tuned the rig, dx kept piling out of a virtually silent background. only when u pulled out the antenna, could u realise that the background noise WAS there. i guess using an uncluttered front-end, single stage IF and dropping AGC makes for fidelity in a communication receiver.

about the noise ... i think that the antenna was picking up noise due to line current. that is the best explanation i have. now i am going to install a windom at 40 feet tommrow. lets check how that fares

2073. Suggest a linear to boost 0.5 watts to 5 watt level.

Newsgroup: rec.radio.amateur.homebrew

Source record: 32540

continuing on my homebrew transciver, i have a linear chain (quite like that of 144 mhz DSB transmitter by Hayward in Solid State Design) delivering over 600 mW.

I was trying to push a pair of 2N3866 to delivering 1.5 watts each (for a total of 3 watts). But the beasts refuse to cough out more that 1 watt in total. And get unstable above 600 mW.

I am looking for a way to boost the 600mW signal to something like at least 6 watts, but not more than 10 watts.

I have considered the IRF series. I find that the transfer characteristics of the IRF are more suited to CW rather than quality linear operation. Has anyone any luck with the audio medium power transistors that have high Ft Like BD137 etc?

Linearity is a must. I dont want to ask being excused for my 'homebrew' signal.

2079. Static discharge protection questions

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-21 20:25:22 UTC
From: mike <intotheapex@yahoo.com>
Message-ID: <gm1smv0caf1491rebdvp25bevv5qio1b9v@4ax.com>
Source record: 32546

Hey group,

I have a portable radio with no external ground.

Recently I built a PI network antenna tuner in a metal box and included an output for earth ground. So the outer sheild of my coax inputs as well as outputs and the variable capacitor frames are on this ground to earth. The random wire input goes strait to the tuning capacitor thus needs some kind of static drain off.

I have heard using a neon bulb and a 2 watt 2.2k ohm resistor in between the inputs and ground would discharge static buildup and give me some warning of build up conditions.

I am also concerned about limiting the voltage to the receiver front end to prevent damage. I have heard installing back to back high speed diodes between the imputs and ground would acheive this.

I understand everything but the diodes. What does back to back mean. I recall diodes are one way, but which way goes where? Should I look for a certain type or rating of diode?

Thanks for your help,

Mike

2080. Schematic/PCB CAD pgms

Newsgroup: rec.radio.amateur.homebrew

Source record: 32447

I have been a fan of ORCAD SDT Schematic Capture and still
run a DOS version.
Would anyone know of a freeware outdated Windows version?
Similarly I would like one the earlier Windows versions of
Tango PCB.
These DOS versions are not any more very compatible with
MSW XP though with some patience they are still usable.

I am so used to using these programs for odd jobs that
changing to a different one would be too much of a learning
curve.
I could run a seperate PC in DOS just for both of them of course,
but rather not.

Any advice will be appreciated,
Thanks
Hans

I'm slightly perplexed. Why has no one picked up on the obvious: in an age of ever rising gas prices, surely the only reason one would travel in a different car to his spouse is to _avoid_ hearing her!

However, I'd opt for the CB deal. It's legal, it works & if there's a breakdown it can be used to contact someone else - much better than private band radio, ham or radio mic for this.

I can't help thinking your kids would much rather you to use one car & leave the air just a little less polluted!!

Happy shopping.

Back to back: Take your two diodes and install them in parallel, but with one 'pointing' in the opposite direction. The idea is that, because each diode will conduct when the voltage rises above it's threashold, it doesn't matter if the spike is positive or negative. A radio signal is highly unlikely to be powerful enough to force either diode to conduct (and if it did, they'll protect the RX front end).

I don't think they'd help much however! You only have to think about the kind of potential in a static build-up to decide that you do not want to rely on a pair of diodes to keep everything calm. Far better to make sure your aerial has a DIRECT path to earth - a low impedence one at that. Best way to avoid static damage? Disconnect the hardware from the wire when you think there's static about. Oh - and avoid using headphones....

Good luck.

I think don't talk to much about it before reading the patent application WO 02/45210 A1 or PCT/NO01/00441. Inside there are links to other patents... Cannot say more, must read it first.
One nice think about patents: You don't need to pay something for it if you use it privately. Offering a device to others is not allowed. Just make your own if possible (materials, construction, opened infos can make it impossivble). Ideal for hams, electronics hobbyists.

OK I get it now.

As for an earth ground......I found a nice fat copper braided wire
coming off the metal roof lightning protectors (this is an old
farmhouse) down the side of the house going deep into the ground.

I suspect if I solder a nice fat 12 guage wire to my random wire where
it meets my coax it would suffice in this regard. Additionaly I will
run another wire to this ground from my tuner.

thanks,

mike

A small neon bulb was used in thousands of ARC-5 Command Set
receivers in WW2 for static bleed-off. Similar to an old NE-2 bulb.
No need to use a resistor. The neon will conduct somewhere around
70 Volts and shunt any static pickup to ground...then goes into non-
conducting state until the next static potential build-up.

>I am also concerned about limiting the voltage to the receiver front

You can use practically anything modern in the way of diodes there
but the high-speed types such as 1N914 and 1N4148 are very cheap
and available many places. Varistors could be used (GE "movisters")
or even 1N4000 series rectifier diodes. Diodes have a 0.6 to 0.7 VDC
forward conduction voltage if silicon.

Put them side by side with the anode of one to the cathode of the
other at each end. That will limit voltage input to about 1.4 V peak-to-
peak. You could put a small series resistor, say 22 Ohms or so,
between antenna input and the diodes to limit peak diode current on
conduction. Your option...since the series resistor will drop the RF
input level slightly.

You could also use a high-inductance RF "choke" in place of diodes
and neon bulb. 1 to 5 mHy would work at HF bands. That forms a

constant low-resistance DC path from antenna to ground and keeps
static accumulation bled off immediately.

A CD of a freeware version of ORCAD was given to everyone who wanted one at Microwave Update (or was it Central States VHFS) a couple of years ago. It is fully functional and does not expire, but is limited to a modest number of components - enough for a small two-sheet drawing.

I built my home-brew PDP-8 in a bit-slice way. Each of the main cards had
one bit of the accumulator, memory data register, memory address register
and the "other" register - 12 cards for the main data paths.

As an ancient aside, the "first minicomputer" Whirlwind at MIT was a 16-bit
bit slice machine. There was one whole 6-ft rack for each slice. Thus the
main part of the machine took 16 racks. I never saw the beast, but we (at
USAF Cambridge Research Labs) did do an experiment or two with it driving
our ground to air digital data link. That was in 1953, IIRC. But I was
VERY young back then.....

My first CPU, designed and built as a lab project in 1971, used 16-bit registers and memory words, but the data paths were 1-bit serial. The memory was implemented with a ~9ms acoustic delay line, in which 8192 recirculating bits were stored. One of the neat aspects of this design is that one could continuously view all of memory with a single scope probe! It was unique in its use of a then-newfangled touchtone keypad for entering hexadecimal values into registers, replacing the individual toggle switches customarily used for that purpose. To prove its completion, we programmed it to perform BCD division; after literally seconds of flashing the lights attached to its registers, it halted with the correct result ablaze and the TA intoned "it lives". It was a defining moment...

> kicking around. Can I wind one of these to use a noise reducer?
>

it depends upon what kind of noise you are fighting.
1) the single wire antenna might be picking up noise that is the your receiver room. the most probable source is your PC. try switching off the PC (and the one in the neighbouring rooms) to see if that effects the noise. If PC is the source of noise, you will have to use a shielded cable to get the antenna off your house. start the long wire outside.
2) it might be electric discharge from flourescent lights. again, try switching them out. the electric discharge can go a long way. there might be little you can do about it except move the antenna away. look for noisy water pumps and fan regulators (they use SCRs that create noise).
3) receiver front-end. A poorly matched receiver might overload itself. Turn off the RF amp (if you can) or try using a 200 ohms potentiometer as an attenuator between the rx and the antenna. cut the signal level with the attentuator and boost the audio gain.

single wires are a problem with electrical noise, what i would suggest is use a coax from your receiver to your roof or some place where the you can mount your antenna tuner. DONT use an antenna tuner between the receiver and the coax. that way, it will convert the coax into a part of the antenna and the sheild of the coax will pick up the noise. ground the coax and both ends to ensure proper sheilding. get onto the roof and move the wire around until you can null noise the most.
the other effective scheme might be to use two antennas. (a vertical and a long wire). and connect them both together through a phasing network that will cancel out the common signals. you will need to adjust the phase and amplitude together to achieve a noise null. it is tricky but it can be done. check the passing comment on wes hayward's home page about his experience. (it is on the page where he describes his current home setup).

Wow.....70 volts seems a tad high to be protective in my solid state
portable. I suspect the older vacuum tube sets were far more static
resistant. I've read the limit for my sony portable should be kept
below 0.7volts to keep the sensitive front end electronics safe.

I've read suggestions for resistors ranging from 2.2 k ohms to 56 k
ohms all the way up to 100 k ohms. The most recent information being
the lowest value resistors. From the schematics I have seen, the
resistors were placed in parralel between the antenna input and ground
input. Or in the case of a two wire unbalanced input, between each
wire and the case of the tuner which is grounded.

Guess I might have to just play resistor values and see what doesnt
hurt signal strenth (another suggestion I read).

good information though, thanks. - mike

Check out this website, its quite useful and has many different java calculators for finding the inductance values of both toroid and air form coils. I used the calculator to create a 3uh coil and it came out pretty darn close to what I intended. (never bridge measured it though)

2098. PROJECT: next generation SWR/wattmeter

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-22 15:00:16 UTC
From: jason_hsu@my-deja.com
Message-ID: <f7d9a152.0309220700.f99aebc@posting.google.com>

Last semester, I designed and built the QROP Meter for my graduate school independent study project. Thanks to those of you who helped me with certain thorny issues, such as transformers and DC amplification. Go to my web page at http://www.jasonhsu.com/ee.html to learn how to build the instrument.

What makes my SWR/wattmeter different from the numerous versions available from MFJ and the numerous homebrew designs out there?

1. Works from 200mW to 100W! You get the best of both worlds! MFJ SWR/wattmeters don't work at QRP, and QRP SWR/wattmeters can't handle 100W. Tuning up at 1W instead of 100W reduces the QRM you cause by 20dB, or over 3 S units! You can also safely change the tuner's inductance taps WHILE transmitting at 1W.
2. GOOD resolution at SWR values above 3 and even above 5! This can be very handy at 160m and 80/75m.
3. 10-LED display for the SWR meter and another 10-LED display for the wattmeter: No more squinting at cross-needle meters!
4. More accuracy at low power levels: Most SWR meters understate SWR at low power levels due to the infamous diode drop loss. My design compensates for this and allows accurate SWR measurements at QRP power levels.

Let me know what you think, and feel free to contact me if you have any questions or suggestions. If you decide to build the QROP Meter, let me know how it goes.

Hello-
I have an unpopulated PC board from the Small Parts Center purchased in 1988 for the W7EL Optimized 40 Meter Transcvr.
I have some questions please :
1. As I understand it the OHR Sprint was a copy of this W7EL design, can anyone verify that the PC boards were, in fact, the same?
2. Can anyone furnish me the complete building instructions for the OHR Sprint?
Any other info on this would be greatly appreciated, thanks,
Byron WA5THJ.

Lookup eddy currents, skin effect depth, etc.

Placing an antenna in a _closed_ conductive box is not the best way to make an efficient antenna. Only if the box has a slot the energy may seep though that - but that's not in "Our tiny antenna can be placed in the car or cast in metal, and is at least as good". I see casting in metal as a closed box. The antenna will be shielded unless they use VERY slow changing signals. Not good for efficiency either.

Take a working old MW transistor radio with ferrite antenna and wrap it in Alum foil. Make sure the edges make contact. You may puncture small holes to hear the sound - or rather, notice the lack of it.

Nice project. People interested in learning more about the diode compensation circuit can find additional information in John Grebenkemper's article "The Tandem Match -- An Accurate Directional Wattmeter", QST, Jan, 1987, and a good deal more in my article "A Simple and Accurate QRP Directional Wattmeter" in February 1990 QST.. It turns out that you can reduce the diode drop to an arbitrarily low value by terminating it with an arbitrarily high resistance. But that's not the problem in detecting small signals. The problem is that the diode reverse leakage current becomes a bigger and bigger fraction of the forward current as the current gets smaller. That is, the diode becomes more and more like a resistor as the signal gets smaller and smaller. The problem, then, isn't a lack of forward conduction, but that the charge conducted into the load during the positive half cycle is sucked back out during the negative half cycle. The compensation circuit used in these two articles and in Jason's circuit only approximately match the RF conductivity characteristics of the diode, and the operating points of the diodes have to be carefully chosen to insure tracking with temperature changes as well as signal level.

I can answer the first question.

There were no boards included in the Optimized article, nor did I ever design one. Since there was no original board, there is no board which can be the same as the original. Any boards or commercial versions of this rig were done by third parties without my participation, and often with design modifications or component substitutions for the convenience of the vendor.

2110. Iron powder vs. ferrite cores for low-power inductors

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-22 19:30:18 UTC
From: jason_hsu@my-deja.com

Source record: 32477

Yes, this is related to the noise cancelling device described at
http://www.geocities.com/g4lna/noisdes.html

I'm trying to figure out if I can substitute type 61 or type 43
ferrites for the transformers, because I have these ferrite ring cores
but I do not have the iron powder toroids. Also, using type 43
ferrites would allow me to use fewer turns. (That 160m/180m
transformer requires about 50 turns!) From my experience with
high-power RF transformers, I know that iron powder toroids are less
vulnerable to core saturation and excess heating.

The phase shifter and the amplifier in the noise cancelling device do
NOT work with high power levels like a transmitter, tuner, or
SWR/wattmeter would. So if core saturation and excess heating are not
an issue, is there any particular reason I MUST use iron powder
instead of ferrites?

I bought a surplus IBM 1620 core memory stack from Burstein-Applebee. I found a couple of the connecting wires were never properly soldered - which must have been the reason for junking it. The 1620 had 10,000 12-bit words of core. Actually every location had two 6-bit memory words. The 1620 was a variable word length machine, with one bit of each 6-bit memory word being the "word mark". I only used 4096 12-bit words of the memory, the normal PDP-8 memory size. DEC's interactive FOCAL language allow easy programming of simple problems. I also had their assembler.

The thing is buried in my garage, minus some big electrolytics.

For Static control, I have a 1 megaohm 1/2 watt resistor to ground from each side of my antenna. I do this because my balanced antenna tuner does not have a DC path to ground.

Notice I said STATIC control, not Lightening arresting.

You can use a much lower value. The resistor should be large compared to the impeadence of your anteanna. So if the antenna is 4,000 ohms, even a 400,000 ohm resistor would be 100 times the antenna value.

The transformers in that circuit are tuned; that is, they're basically tank circuits with a secondary winding for impedance transformation. So type 43 ferrite would be a very poor choice, since it has a Q of 1 at a few MHz. You need a core material that maintains a decent Q at the frequency of interest. Type 61 isn't too awfully bad from a Q standpoint at lower HF, but you'll have a very strong temperature dependence. There are a couple of other 60 series ferrites that might be better -- check out the Fair-Rite web site. I'd use a bigger powdered iron core, myself. Going to type 2 material will reduce the required number of turns, and will probably reduce the Q only slightly.

I might even consider a type 1 core for that 160 meter coil. The type 6 specified in the web page seems like an unlikely choice for that frequency.

Reading the article, he indicated it didn't work that well when he used chokes in the tank, which is pretty close to what you will have with the ferrite cores.

Presumably you're in the U.S., you can get toriods pretty cheaply (and quickly) from http://kitsandparts.com, although he does sell them in big bunches. You can order oneseys from http://www.palomar-engineers.com but in my experience they are pretty slow, and by the time you pay their shipping, you may as well have spent the same money at kitsandparts and gotten ten times as many toroids.

Yeah, I've got to also consider placing this joker in the kill file.
Certainly not worth the blood pressure rise.

2116. EBay SPOOF going around

That makes sense.................a single stage I.F. will give you about 20
to 30dB of gain. This would give a quieter sounding receive, especially
with no AGC.
Keep on plugging..........it sounds like a fun project!

Pete

HICKORY, NC [UPDATE]: The FCC wrote General licensee John A. Abernethy, K4OKA, July 27, 1999, modifying his license to prohibit operation below 30 MHz for 180 days, effective immediately. Unless he appeals the action, Abernethy may not get back on HF until January 22, 2000. The FCC letter included a copy of a tape recording--supplied by complainants--of transmissions said to be of Abernethy's station on July 16. Hollingsworth's letter described the tape as "consisting of deliberate interference on 3.965 MHz." In the letter, FCC Attorney Riley Hollingsworth, K4ZDH, noted that Abernethy had been warned about deliberate interference at the time his station was inspected last January. Abernethy has 30 days to protest the sanction. FCC personnel inspected Abernethy's station January 21 and 22 in the wake of what Hollingsworth called "longstanding complaints from other amateurs and from our field offices." In particular, he said, the FCC had received "numerous complaints" about profanity, obscenity, deliberate interference, and failure to properly identify. Other complaints to the FCC alleged that Abernethy had aired something called the "Porkbutt Song," the letter said, "for the purpose of harassment or deliberate interference." Hollingsworth said the FCC's High Frequency Direction Finding Center in Maryland tracked the transmissions of the "Porkbutt Song" to K4OKA. The FCC letter also said the Commission had received complaints that Abernethy had used AM and upper sideband on 75 "for the purpose of interference" on or near 3894.5 kHz. Abernethy also was warned in the letter about over-power operation. Hollingsworth said that the FCC has no plans to start revocation proceedings against Abernethy "unless we have evidence of continued violations" of the type the FCC described in its July 27 letter. (For additional details, see "FCC Takes North Carolina Ham off HF for Six Months" elsewhere on the AWE news page.)

I wonder if FCC knows he's up to it again?
Maybe we should refer them to this NG...
I don't know if it's such a smart idea for him to brag about his illegal activities on a public newsgroup which is archived by servers everywhere for permanent storage. Especially when everybody knows exactly who he is.

The main positive quality of powdered iron cores is their high saturation flux. The dispersion of iron in a nonconductive matrix also gives them low eddy current losses. But if you don't need the saturation flux (which is usually the case for inductors that are not carrying a large DC current) then you can substitute a ferrite core with an air gap.

The ferrite core will have some eddy current losses (dependent on the bulk conductivity) and hysterisis losses (depending on the BH loop area), but you can keep both of these arbitrarily low by increasing the air gap and the turns count. Type 61 has a very high bulk resistivity, but both type 43 and type 61 have pretty big BH loop areas. Have you got any of those type 43 split cores that are clamped around wires to suppress EMI? With a small air gap, they make pretty good RF inductor cores.

Getting core memories to work was black magic with the original designers at your side; that's something that you got a 1620 stack working on your own. For the price of a few electrolytics -- or a new switching PS -- and a few more hours, it definitely sounds worth resuscitating.

Allow me to correct a number. The strike voltage of a typical small
neon bulb is high but once struck, and a resistor is in series with it,
the bulb potential is around 50 VDC.

Yes, that IS a high voltage, but I encountered it on a (roughly) 200
foot long-wire that the previous apartment owner had put up to a
utility pole prior to 1947. The little bulb in the ARC-5 receiver DID
light. On learning some more about neon bulbs (I was 14 at the time),
I decided it was not a good thing to have the antenna connected during
electrical storm episodes. :-)

A resistor alone will only serve to bleed off any accumulated voltage charge. Relatively slowly. It is NOT any sort of protection from a spike of voltage created by a nearby lightning episode. Those can be anywhere from a few Volts to 300 Volts peak amplitude, polarity either positive or negative depending on what Mother Nature decides at that moment...

The "back-to-back" diodes serve as clamps to effect a sudden low-impedance shunt across the input once they conduct past around 0.7 Volts forward (it's not sudden, but gradual, the Z curve has a lot of slope steepness until it really begins to conduct). The reason I mentioned a _series_ resistor between back-to-back diodes and antenna is for three reasons: It limits the peak current in the diodes; it provides a slight voltage-divider effect to reduce peaks (even on conduction) at receiver input; it reduces the rise time of the static peak through a tiny R-C filter effect using the diodes' junction capacitance.

In truth, NONE of the above is an guarantee of _protection_ of any receiver input. A slow, gradual charge build-up on an antenna isn't going anywhere as long as _all_ the components involved have insulation breakdown voltages that are high. A resistor by itself will bleed off such slow charge build-up attempts. At around 2.7 KOhms or so, that resistance isn't going to affect high-impedance values much at frequencies well away from resonance of the wire antenna.

Since I live in Southern California with a low incidence of electrical storms, I've not concerned myself with electrostatic charges in wire antennas. Being raised in northern Illinois, such were quite common and I've been "bit" by one charge which was probably up around 50 Volts or so on that mentioned long-wire. Lightning storm areas NEED additional protection for outside antennas.

Jason:

Ok for the QRP to barefoot operator, but what about someone that at least occasionally uses an amplifier?

I've got a couple of swr/wattmeters (two meters) that provide everything I need, though they are a bit difficult to read at QRP levels. Autek WM-1 is one of them and currently available, and the other is a SignalCrafter 30 (may not be full name and model, but also not available any more). Both have ranges for 20w, 200w and 2000w full scale, and show average or peak readings. They tend to match one another pretty well, especially considering the WM-1 is less than a year old and the other is probably 20 years old....

Will your meter be able to perform as well? I've found that most LED based metering circuits are horribly inaccurate compared to a needle based meter....

On the other hand, I'd love to see a new meter available, particularly one that would work from qrp levels all the way up to legal limits.... while providing both SWR and Power metering. I really really dislike dual needle interpreted displays.

Thanks

Neon bulbs are curious critters. As you say, they have hysteresis -- a higher strike voltage than sustaining voltage. The company I worked for once used them as low current regulators here and there, as well as for static protection, so they bought or selected them to various specifications for strike and sustaining voltages. Strike voltages varied from 55 minimum to 135 maximum, and sustaining specs went from a minimum of 46 to a maximum of 78. They also exhibited a "dark effect", which I believe was that the strike voltage was dependent on the ambient light level. I recall that a trace radioactive material was added to some -- to reduce the "dark effect", I think, by keeping the gas close to ionization. I imagine the sustaining voltage was controlled by the mixture and pressure of gas.

The bulbs were commonly used as pilot lamps, but not when the supply was DC. (This lesson was learned the hard way, judging by company documents and app notes.) Depending on the supply impedance, the pilot bulb could become a relaxation oscillator, interfering with sensitive circuitry.

I came in just as their day was ending.

It has enough sentimental value to keep, for now, but I guess I don't see any real reason to resuscitate it. Emulation on a modern PC would run many times as fast. I have kept all the paper tape software and the "high-speed" paper tape reader.

As to the core memory, I lucked out.

The 1620 stack had a two-level scheme to drive the 100 x 100 grid of selection wires. There were two sets of 100 switch cores that actually drove the wires in the core stack, one set for each axis. Each of those 200 switch cores was threaded with two wires itself - a total of 20 wires for each set of 100 switch cores. You put a pulse through the two wires threaded through a particular switch core to make it flip - thus sending a pulse on a desired selection wire in the main core stack. You could think of the switch cores as a decimal decoder. There were ten "10s" wires, and ten "units" wires threaded through the set of 100 switch cores. Simultaneously pulse the "70" and the "3" wires to the switch cores and the "73" selection wire to one axis of the main core stack was pulsed. The other axis of the main core stack had a similar scheme.

Since I was only implementing 4096 locations, I didn't have to drive all the "10s" and "units" wires to the switch cores. I had to drive 64 of the 100 switch cores on each axis - and I could use any 64 I wanted. I split the 12-bit address into two 6-bit halves and drove the switch cores with decoded versions from the 6-bit half associated with that axis of the main memory stack. The 64 switch cores for each axis only required use of 8 of the "10s" lines and 8 of the "units" wires through the switch cores for that axis - a total of 16 drivers per axis or 32 total switch core drivers - far better than the 128 I would have needed to directly drive the main core stack selection wires.

The 1620 core stack was thus a little unconventional, but was a big win for me.

Jason,
The circuit looks very useful. The layout of the LEDs is not
very typical, which makes it a bit unnatural to use. That is
easy to change. Can you provide some inside photographs
to show how you did the circuit layout?

I am not sure why people even use SWR as a measurement for
reflected power. Perhaps it provides a nice mathematic
simplification, but it is a very quirky and unnatural scale
for human operators: 1) it does not go to zero, 2) it is
hard to read/write/and even say, 3) without a forward
reading, a SWR of 1:1 could simply indicate no forward
power, and the useful range ends at 3. What is needed
is a scale that based on a 2-dimentional vector. For
example, magnitude and angle of a vector that is formed
from an X-axis of forward power and a y-axis of reflected
power. The difficulty is mostly converting this to
a graphical representation. An array of 100 LEDs is
not very practical (10 x 10), but perhaps a tiny LCD
is. A small LCD and microprocessor could be cheaper
and easier to read than cross needles.

Silly me, I put them all in parallel.<grin>. I am a mechanic with some
electrical knowledge, but not much electronics. So the resistor should
be in series with the diodes to limit current.

A side effect I noticed after installing the 1N914 diodes was images
scattered across the bands. For example, wwcr on 3200 was also on
2300. Another gentleman posted me link in the antenna group where he
found the same thing happening.

Might the resistor in series with the diodes reduce this side effect?

I chose 2.2k ohm 1/4 watt resistors. Couldnt find any higher wattages
at Radio Shack. This was the latest resistance value recommended by
Arnie Coro at Radio Habana.

I live in Vermont. We get some lightning but not that much. My main concern is static buildup due to wind and the elements.

The inductance, length, diameter, wire size, number of turns, and much more information on single-layer coils of any proportions, long and thin, short and fat, can be accurately calculated using program SOLNOID3.

Q, self capacitance, self resonant frequency, tuning capacitance for a particular frequency, temperature-rise for given applied RF volts, etc. can all be calculated. Covers mini-coils in UHF receivers to high-power transmitter tank coils, antenna tuners and traps.

You will never need another solenoid calculator. Beats them all!

Download in a few seconds directly to an icon on your desktop, small self-contained, user friendly program SOLNOID3 from website below. No unzipping inconvenience. Run immediately. No training course needed.

Go to the "Download from here" page and browse through a list of other programs written to professional standards available.

Roy,

I recall as a kid making a "Decision Maker" project that used two neons
to indicate Yes and No. My father thought it was pretty cool, especially
when I mentioned that I had noticed it came up on Yes more often. I told
him I'd fix it but he seemed insistent that I leave it the way it was.

I didn't see it much after that, but suspect it played a part in some
gambling game in which he held a decided advantage while being able to
claim a totally impartial device. ;-)

Gang, it's just a troll, fercryinoutloud! They've been around
since the early days of Usenet, and their entire existence seems to be
centered around making outrageous posts just to see what kind of replies
they get.

Just killfile him and be at peace. Don't even waste your energy on
a reply.

> occasionally uses an amplifier?
>
The only thing I can think of is using more turns in the transformers
and thus lowering the coupling ratio. This would increase the QRO
capability but at the expense of QRP capability. I designed the QROP
Meter to just barely handle 200W so it could easily handle 100W. It's
not designed to be used with an amplifier. I don't have an amplifier,
so 1500W capability was not a priority for me.

The closest thing to what you are looking for is the Tandem Match
Directional Wattmeter project that Roy alluded to. It's available in
the _ARRL Antenna Book_. In fact, I got the idea of separating the RF
and DC grounds from the Tandem Match Directional Wattmeter. You'll
also notice my QROP Meter and a few of the homebrew SWR/wattmeter
designs out there have similarities to the Tandem project, such as the
directional coupler design and the noninverting logarithmic op amp.

Believe it or not, I wanted even more QRP capability (like 1mW instead
of 200mW) than my project actually delivers. However, I found several
constraints:
1. Op amps have offset voltages, and these constrain the accuracy of
low-power measurements. Chopper amps have extremely low offset
voltages, but giving them a 10V input while the power supply is turned
off destroys them.
2. The active rectifier has limited accuracy. It's fine in dealing
with 100mV, but it would be useless in rectifying 10mV.
3. The LM3914 chip has limited accuracy. The internal comparator
amplifiers have a few mV of offset voltages.

> I've got a couple of swr/wattmeters (two meters) that provide everything I

>
> Will your meter be able to perform as well? I've found that most LED
> based metering circuits are horribly inaccurate compared to a needle based

> meter....
>
My QROP Meter needs to have diode pairs that are properly matched, and
the proper resistance value for the noninverting logarithmic op amp
will vary from one unit to another. If you don't bother to properly
match the diodes or if you don't select the right resistance value,
the instrument will be just as crude as the conventional products
manufactured by MFJ and other companies. Of course, the need to
customize every single unit would kill the manufacturability, and this
would explain why the products on the market are so crude.

> On the other hand, I'd love to see a new meter available, particularly one
> that would work from qrp levels all the way up to legal limits.... while
> providing both SWR and Power metering. I really really dislike dual
> needle interpreted displays.
>
That's even MORE ambitious than my QROP Meter. I'm sure this
QRP-to-1500W instrument could be designed and built, but it would be
MUCH more complicated and expensive than my device. I'm not sure the
market would bear the cost of such a device, which may cost $1000 for
all I know. I highly doubt that even my QROP Meter has a viable
market. Also remember that the QRP-to-1500W device would have to
compete with antenna analyzers, which are only around $300 and show
FAR more detail than an SWR meter. True, you can't transmit 100W
(much less 1500W) into an antenna analyzer, but antenna analyzers
allow you to tune up without emitting a single mW from your
transmitter.

2144. Fuel Tanks and Cereal Silos as Cavity Resonators for HF

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-23 15:32:41 UTC
From: n1jpr@hotmail.com
Message-ID: <95a201e0.0309230732.71b4ea40@posting.google.com>
Source record: 32363

Just out of curiosity - Did anyone ever try a cabinet-sized or room-sized cavity resonator as roof filter in a HF receiving system?

I've trawled a bit for construction details, and found that a squat cylindrical resonator may have a radius of a quarter wave, so say...

IF, MHz Diameter, feet what on earth?
---
100 .49 a big can?
45 11 a fuel tank?
9 55 ????

It would be cool to use a whole room as a resonator, adding furniture or guests as a way of trimming frequency or Q factor.

For mobile use, one might consider using a whole truck trailer as a resonator.

I would not mind dumping a truck trailer behind the sheds at my parents' farm and running some coax there and back, for a bit of HF work during my weekend visits. Besides, they also have a couple of unused silos, with cavities 15 ft in diameter and about 40 ft height. I wonder if such cavities in series would be tight enough to provide enough selectivity for CW work. They also have a huge pistoning lid hanging inside from a crane, which could be used for tuning. So perhaps they could provide ALL the filtering right at the fundamental frequency, like: rhombic antenna -> coupler -> silo 1 -> coupler -> silo 2 -> coupler -> product detector -> audio chain. Too bad they're reinforced concrete and would need lining. A neighbour & friend has new, shiny, airtight aluminum ones. His son is an electrical engineer. Hmmmm.

Please do laugh, but comment constructively! I am an ignorant coil-winder. Where do I read up on resonators and coupling? I would not mind experimenting with a stack of barrel-sized filters if the numbers warrant it.

Better yet, killfile him and create a message rule like this:

Apply this rule after the message arrives
Where the Subject line contains '3.894' or '3894' or 'bigal'
Delete it

That way you not only kill the messanger but all the
inane followups to the thread - end of problem.

Ken

Hi Jason,

1. Op Amps have offset voltage compensation circuits (either
internal, or you can access 50 years of literature on how to do it
externally). Your choice for a self-destructing chopper amp is your
own problem, not an inherent failure of the class of device. Again,
there are 50 years of literature on how to build your own if the
devices your limit yourself to are either a. too expensive, or b. too
fragile.

2. Active rectifiers having limited accuracy is strictly a problem of
GBWP. Choose a crappy one, and you fulfill your nightmare. For HF,
you should be using one with at least 1GHz. Your problem then becomes
one of selecting an amp that is stable at unity gain (or at least
stable at the gain you choose/need). Complaints about not being able
to handle 10mV signals only suggest you need an amplifying buffer
before the detector. With a little leg work (researching that same 50
years worth of application design), a second diode, and feed back, you
could linearize the power/SWR meter too.

3. LM3914 should be designed with the usual offset compensation if
that is a problem. However, even with a few mV out of 10V, the
dynamic range is considerably greater than your instrument's range.
Your problem is one of scaling your signal (it shows in the other
complaints). Dynamic range, 20 log (10V/10mV), borders on 60dB where
accuracy would tend to go to hell at the low end. You show only 30dB
of dynamic range, 10 log (200W/200mW). You are not using the full
potential of the device.

Compensation circuits can run from simple to complex. If you have zero compensation, you are abandoning your fate. Reading National Semiconductor product literature would be a simple approach to a great deal of variety of design:
http://cache.national.com/ds/LM/LM3914.pdf

I'm not laughing! In the 60's, we had a problem with a shielded room.
The electrical noise within it was horrendous. It turned out that the
room size happened to be just right to resonate with the radiation from

the gigantic 5 MW SAGE radar which was just hundreds of feet away. the solution was to move the sensitive gear out of that room and to another. There was no way we could modify the radar nor the room; esp. the radar which had a football field sized rotating antenna.

Not sure how the thread made it past my kill file, but to respond to your comment, I only went with what I was told and seen for myself as witnessed above.. IF there was more than one incident mentioned, then I didn't notice in my speed read of the article.
But, if it's been more than once, then maybe it's time they show him they're done playing games.
Lou

Bear in mind that I'm talking about automated electronic gear here,
not manual intervention. Electronics works in time spans a lot
quicker than 10 ms.

> over a
>pretty wide band of freq's (this is why synchronization of the radios
>on a time basis is critical to succesful operation of the net).

So the frequency changes are pre-determined on a time basis?

If there is a radio receiver, is it better able to detect/deceive a
signal whgen it knows the frequency in advance? Or can it "sniff"
for lots of frequencies at a time and pick out what looks
interesting?

If two receivers, placed say 10 m aparet, both pick up a signal, how
accurately can the time difference between the repetion of both
signals be calculated? Light moves 30 cm in 1 ns, so if time
differences can be calculated to an accuracy of 0.1 ns, then
direction could be resolved to an accuracy of 3 cm/10 m ~= 3 mrad.

Alternately, would something like a pinhole camera work? What I mean
here is: imagine a cubic metal box, 1 m on its side, with a vertical
slit, about 1 cm wide down one of its vertical faces. On the
opposite face, there are detectors for detecting radio waves. If the
elevctromatnetic ratiation coming into the box can only go in

through the slit, and goes in a straight line, then knowing which detectors are lit up would allow someone to tell where the radiation was coming from. It may be that, depending on the wavelength, the incoming radiation would be diffracted by the slit and would get spread all over the detectors. If this is the case, perehaps multiple slits could be used, and the diffraction pattern would differ dependent on the angle with which the radiation strikes the slitted face? (because the radation at each slit would be out-of-phase with the radiation at other slits). Has anything like this been tried?

> It is

What methods are used to do DF?

I am aware that some op amps have offset voltage compensation
circuits, but they require adjusting a potentiometer. I don't like
potentiometers and prefer to design a circuit to avoid the need for
one. There probably are better solutions than the active rectifier
design I went with, but they would have been more complicated.

> 2. Active rectifiers having limited accuracy is strictly a problem of

>
I had originally thought of using RF amplifiers in my design, but RF
amplifiers are not available in DIP format. So I switched to
rectifying the RF with Ge diodes and then using a noninverting
logarithmic op amp to compensate for the diode drop loss. The
experience also taught me to be less reliant on PSPICE in the future.
Just try to model an LM324 with the negative power supply grounded.
An LM324 doesn't need that negative power supply in real life, but it
does in PSPICE.

> 3. LM3914 should be designed with the usual offset compensation if

> potential of the device.

>
In the original version, I had 2 LM3914 amplifiers cascaded for 20 LEDs for the SWR display. When I wasn't transmitting, several of the LEDs would often come on, presumably because of the near-zero voltages on the low, signal, and high voltage ports. The instrument also didn't have the accuracy needed to justify 20 LEDs, and a 7-inch by 3-inch face does not have enough room for 40 LEDs.

You can always try to improve on my QROP Meter, just as my QROP Meter idea was inspired by my dissatisfaction with conventional SWR/wattmeters and the numerous homebrew designs I had looked at. And yes, I obtained many of my ideas from other people's designs. I found an LED-based SWR meter for VHF in the ARRL's archived articles. The noninverting logarithmic op amp to compensate for the diode drop loss and the directional coupler for sampling forward and reflected voltages came from several homebrew projects on the net plus the ARRL Antenna Book's Tandem Wattmeter project.

2165. Anybody actually heard "BIG AL" on the air?

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-23 23:41:28 UTC
From: Greg Courville <EngNOSPAMinuitor@Gee-Enginuity.com>

As most of you know, there is a troll on these boards claiming to be K40KA. I'm still trying to figure out whether this guy is just trying to be annoying. If he is actually doing what he said he is, we can go to the FCC, so I'd like to find out if he's actually on the air. Not owning any HF equipment, I can't do much my self. If somebody could listen in when he says he'll be transmitting...

Well first off, the reference violation above is long done with. He spent his time in radio prison and returned to the HF bands. He has basically learned his lesson, this time. And has been a decent operator for several years now.

What I was refering to was he was removed from the radio voluntarily in lieu of being fined a big chunk of bux back in the 70s. He stayed off the air for years. Returned as KJ4JX and began his crap again. He later got his original call back under the vanity system.

He has been a QRMer for many years. BUT as stated above has finally seen the light.

This crap you see here from "BIG AL" is BS.. And same for the "3894.5" crap. Its just a troll.

But I wanted to set the record straight.

Dan/W4NTI

It'd s troll. Big AL gets on occasionaly on 3894.5 and talks with whats left of his "Abernathy Radio Group". Without his Henry 8K of course.

So don't worry about it.

Well, whatever.. I'm kill filing everything and anything that comes across
about this after this response. If need be, remove the news group as well. I
won't miss it for a while. But I'm not going to get caught up in this
childish bull shit any more than I've already been suckered into doing..
Yeah, I DO fail once in a while! Lou

SpamLover (n1jpr@hotmail.com) writes:
> Just out of curiosity - Did anyone ever try a cabinet-sized or
> room-sized cavity resonator as roof filter in a HF receiving system?
>
Someone did some work with 10meter cavities out of oil drums. He
wrote about it in 73 back in 1970 or so. But his goal wasn't
the cavities, but some weird modulation scheme that I'm not sure
really made sense, so I don't think the articles gave a lot of
detail to the cavities, and since the whole thing seemed hair-brained,
it might not be the best source of experience on HF cavities.

In the June (or maybe it was May?) 1972 issue of QST, there was
an article about making a filter out of a metal garbage can for
2meters. But of course, at those frequencies, a cavity is not
an exceptional sight.

There have been some articles, in QST and I think Ham Radio (in
the mid-seventies) about HF helical coils. That sort of filter
might be more realistic than a cavity at HF.

Yeah, if you look at some of the other Big-Al threads you'll see that we've decided he's not for real.
Now we're trying to get him for violations of Supernews's policy. Write to abuse@supernews.com and attach segments of his posts. Maybe then he'll have to post directly...

So what? Unless you know the frequency hopping plan ahead of time
(something that is rather closely guarded), you can't capture enough
of the transmission to do you any good--they use a rather broad
spectrum.

> for lots of frequencies at a time and pick out what looks
> interesting?

Both radios have to be loaded with the same frequency hopping (FH) plan, and then they have to be synchronized by time. When SINGCARS first came out the time synch had to be done by having the net control station (NCS) perform periodic radio checks (each time your radio "talked" to the NCS, it resynchronized to the NCS time hack); failure to do this could result in the net "splitting", with some of your radios on one hack, and the rest on another, meaning the two could not talk to each other. I believe that the newer versions (known as SINCGARS EPLRS, for enhanced precision location system) may use GPS time data, ensuring that everyone is always on the same time scale.

Yes, you can set up to scan various nets (we did so for command post operations where we wanted to monitor multiple nets), but they all have to be on that same time hack, and you have to have each net's FH plan loaded; you can't just decide to operate it like a police scanner and listen in on whoever you choose to.

The fact is that the direction finding (DF'ing) of frequency agile commo equipment is extremely difficult for the best of the world's intel folks, and darned near impossible for the rest (which is most of the rest of the world); that is why US radio procedures are a bit more relaxed than they used to be before the advent of FH, back when we tried to keep our transmissions to no more than five seconds at a time with lots of "breaks" in long messages to make DF'ing more difficult.

> this been tried?

Hey, I just *used* the critters and was fortunate enough to attend new equipment training from the manufacturer when we got it; suffice it to say that use of FH makes DF'ing a remote concern, pretty much eliminates any concern over jamming (even broad band jamming can only

take down a small percentage of the available spectrum, making voice transmissions still very clear), and the use of FH combined with crypto key makes it darned near impossible for the bad guy to decypher it in any realistic timely manner.

You'd have to find a signals intel puke to answer that one (but you can rest assured that any really good methods/systems remain classified).

It may be a mixing product due to mixing of RF signals in a diode.

According to US Army Signal Corps FM 24-18 chapter 3 section 7, poor
grounds can be helped with a dose of the following to increase
conductivity (in order of conductivity)

Sodium Chloride
Calcium Chloride
Copper Sulfate
Magnesium Sulfate
Postassium Nitrate

Course they also say dont let it get into the drinking water <grin>

Once the static voltage builds to .7 volt one or the other diode will
conduct and "bleed" it off. Of course that assumes that we're not
talking of lightning-level static charge. In that case all bets are off.

Many HF and MF installations use an RF choke of sufficient impedance
placed across the antenna terminals to provide a discharge path for all
static voltages to be immediately shunted to ground without disturbing
the received radio signal in any way. No static ever builds up on the
antenna. All it takes is a small RF choke of sufficient impedance to be
transparent at the frequency of interest.

Hi Filippo,
some experience is described by Harry SM0VPO at
http://w1.859.telia.com/~u85920178/use/cavity.htm He worked from 28
to 1300 MHz. The biggest object he used was an old galvanised dustbin.

Yes, an emulation would be much faster, but you'd miss those flashing lights.

Tnx for the core explanation. Data General was still stringing their own core memory when I arrived in 1972, and there was a fellow who specialized in designing the read/write circuitry from whom I learned more than I wanted to know. The last models were 32kbyte arrays on 15" square PCBs. We began offering RAM-based memory in 1975, using 2K dynamic RAMs built in DG's Sunnyvale fab; that was the heydey of vertical integration - DG made everything from TTL to tape drives.

73,

Dave, AA6YQ

Their are ready made encoder chips around (don't know of any off hand).

But a PIC or an AVmega cpu would make a very nice ppm or pcm encoder these days.

I read the patent application meantime. But I must say there is not much content in it. Especially nothing how to calculate dimensions, materials or taken measurements.
My understanding is that it is a helix antenna supported with a ferrite powder rod in the axis. And it is electrical much longer than the wavelength used. Adaption to the "ether" field Z(0) with up to 4 stages of different winding/mu(r) value materials. A magnetical antenna very similar to the electrical Yagi antenna. "The antenna works up to 500MHz", he says. "Greater frequency requires lower mu(r)."

Sorry, maybe it won't work at all. I'm not an antenna expert. Maybe the author of the patent will directly respond here sometime?

What do you think?

2189. Long wire transformer idea

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-24 15:05:09 UTC
From: mike <intotheapex@yahoo.com>
Message-ID: <b1c3nvg8kri9661h0fgrn1o9cbp037p2f9@4ax.com>

Given I am currently using 75 ohm coax to feed my random wire, I believe I could use a 300 ohm to 75 ohm (4:1) TV twin lead to coax converter and get away with it.

Please correct me if I am wrong, but I think I would attach the random wire to one terminal of the 300 ohm input. The other would go directly to earth ground, or via a gas arc tube to ground.

On the other side, I would attach my coax cable.

To give the coax feeder a ground at the antenna end, I would to open up the converter and solder in a ground wire on the coax sheild terminal. This would kill off common mode currents.

This would give my antenna feeder system a matching transformer plus give the antenna a direct path to ground.

Theoretically, I am I missing anything?

>>resistors were placed in parralel between the antenna input and ground
>>input. Or in the case of a two wire unbalanced input, between each
>>wire and the case of the tuner which is grounded.

It just depends on how much power you want to "waste" in the paralleled resistor. Think of it this way: IF you had a 50-ohm dipole antenna and you used a 50-ohm resistor across the antenna (and ignoring the effect of a 25-ohm load on your xmtr), half of your power go into the antenna proper and half would be dissipated in the resistor.

That's probably too much, so try a 500-ohm resistor: now about 90% of your xmtr power goes into the antenna and 10% into the resistor.

One more try: 5K-omn resistor: now about 99% goes into the antenna and 1% is wasted in the resistor.

This leads to one of the "rules of thumb" from a beginning EE class oh-so- many years ago: the power loss from paralleling a 100*R-ohm resistor with an R-ohm resistor is essentially negligible.

There is another GOOD effect of using any resistor across your feed line: a simple ohm-meter check from inside the shack can tell you if your feed line is intact!

>Theoretically, I am I missing anything?

You could simple attach the 300-to-75 Ohm matching thing to the long
wire and use the coax...provided that the Z-changing-transformer can
handle HF. It won't be good if it's just a TV accessory; those seldom go
down to 30 MHz.

You might check the "300 Ohm" side of the transformer to see if it
actually has a DC path across it (an Ohmmeter will show that). Such an
accessory doesn't always have a DC path there. If it ain't there, no sense
in using it for your application.

The long-wire's impedance is going to range all over the place on HF so
it won't make much difference to a 75 Ohm coaxial cable feed. Most
frequencies will be way off in impedance matching regardless of the ultimate
impedance of the receiver.

Keeping the coax feedline offers some protection from household QRM
that is between receiver and antenna.

>Might the resistor in series with the diodes reduce this side effect?

The effect should not be there with or without diodes, with or without
any resistors...unless there is some VERY big RF source out of the
receiver's tuning range that is supplying energy to the diodes and
thus causing the "mixer" effect.

It might be possible if you have some Local Oscillator energy leaking
out to the antenna connection, but even that is unlikely given "modern"
(in the last couple of decades) receiver design.

The diodes should not have any effect on anything but a few millivolts
of any signal arriving on your antenna. A non-conducting diode simply
shows a junction capacitance to the rest of the world. That's a minor
reactive discontinuity to the antenna connection.

It might be possible that some unusual circuitry in your receiver presents
a DC Voltage at the antenna port. If so, it might cause one of the diodes
to conduct. It would be better then to AC-couple the back-to-back diodes
to the receiver through a capacitor of 0.001 to 0.01 uFd to eliminate that
possibility. You should be able to measure any DC potential at the
antenna port with a high impedance multimeter.

So transmissions of 5 seconds tend to be hard to DF? Of course, with
the battlefield internet, a text transmission will typically be a
lot less than 5 s (assuming the same bandwidth as for a voice
transmission, i.e. somewhere in the region of 20-60 kbit/s).

>transmissions still very clear), and the use of FH combined with

It does have a DC path so I went ahead and gave it a whirl, plus added
another 60 feet or so to my antenna, which probably didnt help.

Seems to be working OK.

I found a cheap source of T68-2 toroids so I going to pick up 5 or 6
and wind up several giving me an assortment of matching posts like the
ICE transformer. This would allow me to create an internal inductor
for my tuner as well.

What kind of display did you envision rather than a meter? BTW, a VU meter is not the same as an S meter.

What's the source for the VU meters? How cheap? What size?

But chances are pretty good, given the "cheap" bit, that the meters
are just standard 250uA meters, with a VU scale. I've seen plenty of
those where they do not include any bridge inside, and make no attempt
at meeting the requirements of a "proper VU" meter.

In other words, it would just be a cheap sensitive meter, likely physically
small and cheaply built. The local surplus outlet used to have them,
right next to the same sort of meters with an S-meter scale, next to
similar meters with some other scale.

Given that, it's just a meter can be used as an S-meter when it's hooked
up to the AGC line of an existing receiver, maybe with a bit of buffering
so it doesn't load down the AGC.

He's right. Major breaththrough of all possible barriers, the RSA
algorithm. Uncrackable in the lifetime of the serious user, and
crack is entirely predictable with improved computing power and
can be lengthened to compensate.

Mike,

Due to limited space in the roof - I'm renting so won't risk an external antenna - my setup is similar to this. I use an OCF dipole (some call it a Windom but this is incorrect) with a 300 ohm feedline running to a wallplate in the loungeroom. From there it goes to a 4:1 TV-style balun and into 75 ohm coax. Works quite well. The dipole is in parallel with an existing VHF TV antenna, so it should do well at 20 meters too when I finally decide to play up there.

Not sure about your earthing situation, mine didn't need it. The setup looks like this. I'm in Australia if you're worried about the weird orientation:

When I read this thred, I remembered about an antenna that would not need a ground plane, This enabled celphones 65% gain from amtenna looses to body and surroundings.

It was a cylindircal helix, very short. I understood it to be an antenna with differential emission, coaxial electrical feild perhaps.

It should also be noted that when several quite strong out of band
signals are present at the antenna, say ten signals, each with S9+60
dB, which is 50 mVrms (71 mVpeak) into 50 ohms and -13 dBm. On
average, these signals produce a combined signal ten times as large at
-3 dB and the rms voltage is about 150 mV. However, from time to time,
the vectors for each individual signal add up, so you have to add the
voltages for that moment, so the maximum theoretical peak amplitude
is 700 mV (10x71 mV), thus, a single silicon diode starts to conduct,
causing all kinds of mixing products.

Using two (or more) 1N4148 type diodes in series instead of a single
diode in the each back to back pair, will prevent any diode conduction
as long as the peak voltage is larger than 1,4 V in either direction.

The maximum number of diodes in series is determined by the amount of
voltage the following stages will tolerate without disintegrating.
Since most likely there will be some selectivity between this diode
clipper and the first amplifier stage, the amplifier stage will never
see voltages as the limiting voltages in normal operation, but the
diodes will still cut out some abnormal peaks e.g. induced by
lightnings.

Putting multiple diodes in series in the back to back combination also
reduce the capacitances, since the capacitances in each string are in
series.

The fact that you and I think it is unbeatable, doesn't mean it is.

"lifetime of the serious user" what bollocks, you and I have absolutely no
idea what sort of tech/processing power will be available 10 years from now,
let alone 30.

"and crack is entirely predictable with improved computing power" of course
it is...

Ask the good Admiral how confident he was that his system was secure.

Damn near as confident as you are and that worked out so well, didn't it?

2216. Re: Static discharge protection questions

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-25 09:54:42 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <vn5er8htdit0e0@corp.supernews.com>
Source record: 32333

Although 0.7 volts is a good rule of thumb for diode conduction in moderate impedance environments, it's important to keep in mind that diodes don't abruptly "turn on" at a fixed voltage. They conduct *some* current at *all* forward voltages. It just happens to be an exponential function, so it looks kind of like a sharp knee when viewed on a linear I-V scale. What's important here is how well the diode conducts compared to the circuit it's across. On a lab test bench, that's 25 ohms (50 ohm source and 50 ohm load), but it could be more or less when connected across an antenna.

A quick check with a couple of signal generators and a good combiner showed that cross modulation 60 dB below either signal was present when there was about 0.7 volts p-p (peak envelope, that is, at the peaks where both signals are in phase) across a back-to-back pair of 1N914 type diodes with 50 ohms source and load. That's only about 0.35 volts of forward diode voltage. At about 0.8 volts p-p, the cross modulation product was only about 40 dB below either signal. So appreciable cross modulation can occur at least several dB below the 0.7 volt level often considered to be the diode's conduction knee.

Paul's caution about multiple signals is important to note. Also remember that under some circumstances (for example, high Z looking into the antenna, and also looking into a tuner or receiver, from where the diodes are mounted), the diode's Z environment can be higher than 25 ohms, resulting in appreciable cross modulation at lower signal levels.

Roy Lewallen, W7EL

Ever heard of Moore's law?

I've got a pretty good idea. A typical PC now has a 2 GHz CPU, and
about 256 MB RAM.

Assume these double every 18 months. 10 years is about 7 doublings
so in 2003 we'll see PCs with 250 GHz CPUs and 32 GB of RAM.

It uses the entire normal military VHF FM spectrum, 30-88 MHz. ISTR
that the steps in between are measured in 1 KHz increments, as opposed
to the old 10 KHz increments found in older FM radios like the
AN/VRC-12 family, so the number of different frequencies SINGCARS can
use is 58,000.

ISTR the old guidance was to keep transmissions no longer than 5 to 7 seconds without a break (a break normally was announced as part of the message, followed by release of the mic key, then rekeying and continuing the message).

Only if it were so...but thank goodness it is not. Otherwise we would have lost the value of one of our largest and most valuable intel programs, and NSA would no longer exist. Even the cypher keys used by our modern tactical radios (said keys being generated by NSA at the top end, though we now have computers in the field capable of "key generation" using input from that source) are not unbreakable--instead, they are tough enough to break that we can be reasonably assured that the bad guys will not be able to gain any kind of *timely* tactical intel; enough computing power in the hands of the crypto-geeks and they can indeed break them, but it will probably take them a while, not to mention the time to get the data into their hands in the first place.

That's a great idea, and I suspect tthat you're right in the general case. But a modern cryptosystem, badly implemented, will have all manner of vulnerabilities -- most of which are not particularly obvious.

Remember the competition for the successor to DES as the standard crypto algorithm? That was *quite* interesting.

If you are working at low frequencies, I have seen an idea using a very long wire (say 4-5 wavelengths) at a low height above ground (say about 6 feet). The antenna can be directive in it's long axis. It can help to reduce QRM from a particular direction. Of course you need a fair bit of room...

Thanks, that at least makes some sense of the sales story.

> Sorry, maybe it won't work at all. I'm not an antenna expert. Maybe the

> What do you think?

I'm not an expert either, I just got triggered by the nonsensical "will work even when cast in metal" thing. I've constructed enough RF electronics to know when even a thin layer of copper (or aluminium) will shield EMC almost perfectly (closed box aka Faraday cage).

I checked the Norwegian patent office but they cannot afford a decent free publication site like the US has. Do you have a link to the patent or would you care to send a copy to strange.antenna@ademu.com (a temporary address)?

Oh yeah.... do try the experiment and be amazed...

Regards,
Arie de Muynck

On the SINCGARS family it can be the entire region of 30-88 MHz. With FHSS enabled, the hop rate is 10 per second. The hop frequency positioning and increments are set by the touch-screen entry; all the settings go in that way and that is called the "hop set."

One of my work tasks a decade or so ago was to TRY to locate a SINCGARS emitter using a vehicular model's high power setting (not the small output of the manpack PRC-119). While I can't say much about the test details, I think it is safe to say that it was damn difficult! [my little group was really trying to grab that emitter]

In this case the emitter was on all the time. With the manpack version as well as the vehicular version there is a power output selector switch to effectively go "QRP" to a minimum level necessary to maintain a linkage.

The "SIP" (SINCGARS Improvement Program) resulted in ITT Fort Wayne
making the basic R/T in half the original size. Also added was the time
synchronization via a front panel connector to an AN/PSN-11 GPS
receiver...plus full internal voice or data encryption/decryption...voice is
digitized.

Transmissions lasting only a 100 mSec are VERY hard to "see" over
a bandwidth larger than an octave. Trust me on that. :-)

The hop timing is internally coordinated with voice/data transmission
so that you can't really use fixed-carrier narrowband rules of thumb.
The SINCGARS family isn't really in the "battlefield internet" since all
nets are considered separate entities and many can exist in the same
geographical area. The choice of settings and interoperability is up to
the unit Signal Officer.

>>transmissions still very clear), and the use of FH combined with
>>crypto key makes it darned near impossible for the bad guy to decypher
>>it in any realistic timely manner.
>
>Modern crypto is good enough to withstand all cryptanalytic
>attacks.

It is safe to say that even the most modern cryptanalytic attack could
not get much useful information from a SINCGARS net in time to
counter any communications-coordinated military task. SINCGARS is

designed for small-unit land-air tactical operations...it isn't designed or intended for top-level sensitive communications. In its assigned task, the System is VERY good.

ITT Fort Wayne, IN, is the contracted manufacturer of SINCGARS. About a quarter million (!) systems have been built since 1989. The General Dynamics Land Division in FL made some SINCGARS but GD has since downsized its Land Division.

There's an amazing amount of publicly-available information on SINCGARS externals. That includes the frequency range, hop rate, bandwidth, hop increment and so on. What you will NOT get publicly is the details on the essential algorithms hardwired into the ICs within.

One of the good fall-outs of the military electronics programs begun in the 1980s is the improved stability of crystal oscillator packages over temperature and other nasty military environment extremes. That includes things like temperature-compensated voltage-controlled crystal oscillators and more specialized crystal cutting for better control over temperature. Major quartz crystal producers have put that improved technology on the market. Accurate, stable time control is essential to systems like the SINgle Channel Ground-Air Radio System.

True enough. Some friends of mine live near the transmitter site of
AM broadcast transmitter of KMPC in the San Fernando Valley section
of Los Angeles, CA. KMPC is the only high power station in the "Valley"
at 50 KW _into_ the antenna. :-)

Within a few blocks of the KMPC transmitter, ANYTHING is possible
insofar as IMD products, from tube type to solid-state receivers,
some telephones, a few computers, intercoms, etc. :-(

True enough, but an electrostatic pickup during a storm MAY reach
as high as 200 Volts or so. That's a static charge effect during the
build-up period for lightning.

A friend of mine living in the mountains decided he would "scientifically"
measure the electrostatic charge build-up with VTVM connected to a
small strip-chart recorder on a long-wire antenna. Lived at a 4000 foot
elevation. Observation resulted in the "200 V" value. Unfortunately, he
had so much trouble with the cheap strip-chart recorder that storm
season was over by the time he got the recorder working. :-(

Not quite right.

Semiconductor diodes will BEGIN conducting at lower voltages. Do a
V-I curve of forward conduction polarity to see that. That's a simple
test with a low voltage supply, a pot, a resistor, and a low-range
voltmeter.

> Many HF and MF installations use an RF choke of sufficient impedance

>static voltages to be immediately shunted to ground without disturbing
>the received radio signal in any way. No static ever builds up on the
>antenna. All it takes is a small RF choke of sufficient impedance to be
>transparent at the frequency of interest.

Not quite right. A reasonably-high value inductance in parallel with any
antenna is "transparent" at DC (limited to DC resistance) but is a VERY
high value of reactance at RF. X_L = 2 pi L. A 2.5 mHy RFC will have
a reactance of 15.7 KOhms at 1 MHz. Even with a long-wire whose
maximum impedance magnitude might reach 5 KOhms, the effect of
paralleling such an RFC is negligible. [in parallel it would be 3.8 KOhms]
At higher frequencies the inductive reactance is proportionally higher.

What MIGHT happen, depending on the particular inductor, is that the
inductor's self-resonance due to distributed capacity would defeat the
high-frequency reactance. Above self-resonance the RFC would appear
as a capacitor.

In article <vmvt6egqqnp8a9@corp.supernews.com>, Roy Lewallen <w7el@eznec.com>
writes:

>Neon bulbs are curious critters. As you say, they have hysteresis -- a
>higher strike voltage than sustaining voltage. The company I worked for
>once used them as low current regulators here and there, as well as for
>static protection, so they bought or selected them to various
>specifications for strike and sustaining voltages.

Tektronix. :-) I'm thoroughly familiar with the 53n and 54n Tek scopes
and their "seriesed" power supplies. A rather good design concept in
my later opinion. Used to calibrate them at Ramo-Wooldridge Standards
Lab 1959-1961.

According to the parts descriptions they were controlled-characteristic
miniature neon pilot bulbs. That worked out rather well since I only had
one problem among about 300 or so scopes at R-W...and that was due
to the error amplifier (tube circuit), not the voltage reference of the
neon.

Much smaller than the common "high grade" VR tube, a 5651.

>The bulbs were commonly used as pilot lamps, but not when the supply was
>DC. (This lesson was learned the hard way, judging by company documents
>and app notes.) Depending on the supply impedance, the pilot bulb could
>become a relaxation oscillator, interfering with sensitive circuitry.

Heh, Tektronix and several other manufacturers of the 1950-1960 period.

General Electric had that problem in one piece of broadcast TV thing.
Encountered that at WREX-TV in 1956, where it was messing about
with the local color sub-carrier generator.

>I came in just as their day was ending.

I'm glad those are nearly gone. Neons are a nice AC pilot bulb or night
light where the minor heat and supply current is not a problem.

Today is a whole different ballgame with logic supply voltage dropping
to 3.3 VDC and rail supplies for op-amps down to 1.5 VDC. LEDs are
now cheap, take less power, and have different colors. Neon lamps are
rather fixed at orange.

ESD built into many MOS ICs makes it much easier on designers and
users and repair folks. Gotta love it now! :-)

Ladder line will offer little benefit is this kind of setup. Once you ground one side of it, it isnt even ladder line anymore, but is a single wire hookup to the long wire. Running the odd side of the ladder line to ground thru a gas arc makes little sense, since if you are gong to ground the wire in that side of the line, you may as well ground it directly and just get it over with. It is the LIVE side that would need to go thru the gas arc, if you were going to actually implement this setup.

The actual impedance of the long wire will vary with both the length of the wire, and the frequency it is being operated on. Effforts at "matching" this setup thru a "transformer" would assume its impedance will remain more or less constant , which , as I just got done saying, is not the case. You will get no "transformer" activity here with one side of the ladder line grounded anyway.

The reasoning behind your statements concerning "common-mode noise" and coaxial cable escape me. There really is no such thing as "common-mode noise" on a coax cable. either the shield is grounded , or it is not, in which case , the shield does not shield the inner conductor, which is where the radio takes the signal off the coax. It is the center conducter that picks up noise and feeds it to the radio. This is usually due to either the shield of the coax not being grounded or the chassis of the rig not being grounded (which usually accomplishes the shield ground anyway on most rigs). This lets the noise into the coax so that it can get onto the center conducter in the first place. You most certainly would not use things like gas arc supressors in these grounds, since you want a constant connection to ground on these, rather than one that only operates when a high voltage spike appears. Gas arc and gap type supressors are used on parts of the system that are NOT normally directly grounded, like the center conductor of the coax. If a lightning spike appears on the center conductor, then the gas arc or gap will "activate" and feed it to ground, which is the plan here. The rest of the time, the gas arc or gap type supressor is electrically open.

Oddly, when using an ohmmeter on both of my 300 ohm to 75 ohm
transformers, I find continuity between all 4 connections.

There is continuity between both 300 ohm terminals and the center
conductor as well as the sheild. This is normal and expected I am
told. Both the antenna and the coax sheild recieve their ground (at
the moment) from one of the 300 ohm terminals. The other terminal goes
to the antenna. Given this continuity I didnt see a point to giving
the coax sheild another ground as it already has one via this common
ground.

Thanks for the correction. Your idea makes more sense. I would want to
directly ground the antenna, as I have done in practice. The arc tube
would go between the transformer winding and the center conductor?

Its energy gets transfered to the coax center conductor via the
transformer and the shield of the coax is grounded at the transformer
end.

>The actual impedance of the long wire will vary with both the length of the
>wire, and the frequency it is being operated on. Effforts at "matching" this
>setup thru a "transformer" would assume its impedance will remain more or
>less constant , which , as I just got done saying, is not the case. You will
>get no "transformer" activity here with one side of the ladder line grounded
>anyway.
>

In another thread I had questioned the rational of ladder line. Here,
I am using 75 ohm coax. The sheild of the coax is grounded at both
ends to reduce common mode currents. However given the above
statements, effectively the center conductor has a path to ground at
the transformer end, (although that path takes it throught the toroid
windings first).

>The reasoning behind your statements concerning "common-mode noise" and
>coaxial cable escape me. There really is no such thing as "common-mode

>noise" on a coax cable. either the shield is grounded , or it is not, in
>which case , the shield does not shield the inner conductor, which is where
>the radio takes the signal off the coax. It is the center conducter that
>picks up noise and feeds it to the radio. This is usually due to either the
>shield of the coax not being grounded or the chassis of the rig not being
>grounded (which usually accomplishes the shield ground anyway on most rigs).
>This lets the noise into the coax so that it can get onto the center
>conducter in the first place. You most certainly would not use things like
>gas arc supressors in these grounds, since you want a constant connection to
>ground on these, rather than one that only operates when a high voltage
>spike appears. Gas arc and gap type supressors are used on parts of the
>system that are NOT normally directly grounded, like the center conductor of

>

See above statements for clarification. My sheild is directly grounded
at my antenna tuner. The antenna and coax sheilds share a common
ground via the transformer.

As has been mentioned, if the meters that you had found are simply meter movements with a VU scale and no rectifier, then it should work just as well as any other meter in your application.... just that the scale will read VU instead of S-units. They are not the same.
VU meters are used in audio systems such as tape recorders, mixers, etc., and have no relation to an S-meter function. If the VU meters that you found are true VU meters, then they would be unsuitable without gutting the innards of the meter and replacing/redrawing the scale.

Okay, so we know two things about this guy:

1. He's not origional, the best he can do is copy the style of another, allegedly dead, US operator. Badly, as it happens.
2. More interestingly (to me, at least) is that he connects to the Internet from a mainland UK address.

I'll not bother posting his street address on here. It's more fun to deal with this my way when it suits me.

Cheers all

I recently built two Vectronics direct-conversion HF receivers that experience some really bad frequency shifts and microphonics when you tune or handle the radio. Now I understand that direct conversion receivers have that flaw by nature, but is there any way to reduce it without changing the entire receiver circuit? Will the matching metal cabinets help much?

-----------------
Nothing CAN magically guess extraordinarily long primes. That will
never just magically become possible. This intrinsic truth resides
in the very mathematics itself, a fact outside of time and progress,
and not in any technology of any kind.

> "and crack is entirely predictable with improved computing power" of course
> it is...
>
> Ask the good Admiral how confident he was that his system was secure.
----------------------
Irrelevant. His system relied on technology, as any mathematician could
have told him. He merely held his nose and trusted the allies weren't
technically advanced enough to do it quick enough. He lost.
```

But the "bet" that RSA makes is totally different, in that it relies
statistically upon the ABSOLUTE RANDOM unlikelihood of any absolute
guessing of very large prime numbers by machines whose rate of guessing
is limited and well-known as their intrinsic limit. This number is a
VERY VERY VERY large prime number. In case you don't quite get it, the
most used high security prime number size is greater than the number
of atoms in the entire big-bang universe AND greater than even THAT
by an even GREATER multiplier! See the writings of James Bidzos, CEO of
RSA Tech. for these revelations.

> Damn near as confident as you are and that worked out so well, didn't it?

You have absolutely NO IDEA what the fuck you're talking about.

Source record: 32228

If you're starting with a poor design and want to "fix it but don't change anything", I think you're out of luck. Reincarnation is probably the only solution. The one thing you might be able to do without major surgery is to improve the mixer grounding.

The problem is due to LO radiation or other coupling to the front end or the mixer signal port. You've got volts of LO energy on essentially the same frequency as nanovolts of signal, and you need to restrict the mixing of the two to the mixer. It's essential to use a very well balanced mixer, like a diode ring. Pay careful attention to grounding -- all input and output signals to the mixer should be grounded at a single point. Shielding of the LO might be necessary. If it's poorly laid out, the very large circulating currents in the oscillator tank circuit can flow through the ground system in such a way as to couple back into the front end. Those problems can be minimized by grounding the bulk of the oscillator's tank L and C at a single point. Competent layout is the best solution, but you can sometimes minimize the damage by careful controlling of the mixer grounds. LO energy escaping out the antenna connector can cause problems also. This can be minimized by using a well balanced mixer, properly laid out, and a properly laid out and possibly shielded LO. An RF stage will help unless the layout is so poor as to let the signal escape around it, but it's not really necessary.

Direct conversion receivers don't have that flaw by nature. Only poorly designed or laid out ones do. A well-designed direct conversion rig isn't any more complicated than a poor one, but the difference in performance can be remarkable.

Richard, back in the '80s we set up several of these for the SES for
poin-to-point operation from Perth to Carnarvon and Port Hedland.
They offer a huge number of positives for p2p and point-to-area.

There is a CCIR publication "Handbook on High-Frequency Directional
Antennae" published in 1966 which is very good background for anyone
into this area.

More specifically, there is a very specialised report from the
Communications Research Centre in Ottawa titled "Beverage Antennas for
HF Communications, Direction Finding and Over-the horizon Radars" (CRC
Report #1282 - August 1976). This gives in vol2 all sorts of
parameters for HF beverage-type antennae. Gain, takeoff angle,
beamwidth, impedance etc as a function of ground type/condition, wire
length, wire height above ground etc. One VERY good read.

Both are decades old, but the laws of physics and iononspheric
behaviour are pretty stable ;-)

That's true now, but only to a point. That point is the advent of quantum computing, which allows you to effectively solve for all the possible factors in very little time (say 10^500 times faster than conventional computing for this sort of problem). If QC happens, large prime number encryption is crackable in a matter of seconds. And there is at least some reason to beleive that QC is achievable within a couple of decades.

OTOH, the real danger in the near- to mid-term is not crypto-system attack, but physical compromise of the crypto-system (the adversary getting hold of the both the mechanism and the keys themselves). If they have the actual keys, the eavesdroppers can decode RSA just as easily as the intended recipients.

Right. you are going to base national security matter on a rule of thumb
that relates to a typical PC.

Good move.

Source record: 32236

One issue with calculating the required resistance is that most LED's drop
the voltage about 2 volts.
So if you really wanna be accurate, use:
(supply voltage - 2) / (desired current) = reccommended resistor
But it shouldn't matter too much unless you are either using small voltages
or are concerned about exact current draw.

Or DNA computing, sure.

Just an escalation, the power of operations easier one way than the
other persists and an increase in length results in the same safety.

For it to be otherwise you need to postulate that the govt will be
doing its own fundamental research, and it NEVER does, and that it
will develop QC to that level BEFORE the market sells it or the people
developing it steal it and spread it around to prevent a national
monopoly on power, and that's pretty unlikely.

You're a lying shit and a bounder, and you're diddling yourself and
delaying the inevitable.

> Again, ask the Good Admiral D how confident he was that his system was safe.

You're blathering, hoping that line will sustain you while you try
to bluster your way out of this, when the fact is that RSA is
qualitatively different than any systematically crackable cipher.

Not trying to argue your already discredited position anymore Stevie?

Only an idiot would suggest that any code is "Uncrackable in the lifetime of
the serious user" ands so you did.

As has already been shown, RSA isn't uncrackable, but you are.

What, exactly do you think the NSA is doing with all those 'puters they own?
playing Doom?

Of course RSA is uncrackable, just like the good Admirals systems and I
assume he had a lackwitted buffoon just like you telling him that there was
no way anyone could be decrypting our stuff too...

Ain't any such.

> Only an idiot would suggest that any code is "Uncrackable in the lifetime of
> the serious user" ands so you did.

It *IS*!
If you choose to try to crack RSA go to their site and download a
test message and try it. None have done so above the known prime
lengths that are do-able.

> > > Again, ask the Good Admiral D how confident he was that his system was

Which we knew, but it takes for fucking ever statistically.
It can easily be made to take longer than the current age of the
universe.

> but you are.

More of your meaningless blather and ridiculous self-covering.

> What, exactly do you think the NSA is doing with all those 'puters they own?
> playing Doom?

Monitoring un-coded transmissions en masse hoping to flag trends
or conspiracies by other characteristic signatures.

But as for cracking RSA encoded messages or even kiddy porn being
sent encoded from Europe: Not a whole fucking hell of a lot anymore.
They are hoping their hardware will frighten terrorists out of using
commonly available public domain technology to completely defeat them,
while knowing that everyone who knows anything knows they are totally
defeated by any kid with a computer if he bothers to look it up and
download the tools and use a long enough bit-length and a decent
firewall properly installed.

That's irrelevant, because he would have simply been technically
wrong out of his own ignorance of cryptology, whereas I am not.

Hi all,
the wire should be resistor loaded at the far end. It is so-called
"Beverage antenna". If you have several acres of pastures, it is a
perfect solution for DXing.

Mike, I used a 1:9 un-bal transformer, Its early and I'm rushing ,
but, 9 turns trifilar IIRC on an T50-2 toroid. the endfed was about
65' long. I fed it with 75R coax with the ground side of the unbal
going to the screen of the coax.

a bit like this (ant -u-u-----u-u--coax--u-u--gnd)
where --u-u-- is a winding of the unbal.

It worked reasonable well with 10watts on 40m and above using an atu,
but had problems with 80m due to RF feedback. A counterpoise from the
unbal gnd would probably have helped this.
gotta go.

More than one 1 kHz slot is likely to be in use at anyone time,
since you need enough bandwidth for voice. Say 20, then about
1/3000th of the frequency space is in use at any one time.

True, but "enough" happens to be more than all the computers in
existance right now, or likely to exist.

Assume: there are 1 billion computers, each of which can check 1
billion keys/second.

Then a brute-force search on a 128-bit keyspace would take about
10^60 years.

Maybe. And maybe QC will make possible other encryption techniques.

>OTOH, the real danger in the near- to mid-term is not crypto-system attack,

All good cryptosystems are still effective if the adversary knows
the algorithm.

The most effective attacks aren't usually on the systems, but on the
people -- e.g. getting an insider to divulge secrets.

Not sure if you misunderstood ME or who it was Rene! I was posing a question of why Big Al has a fascination now for what seems another man who someone else pointed out was referred to as Pork Butt at some point in time. He - in a previous post - alluded to "you" - being a fag..... So, I was questioning HIS reasoning there, when it is HIM who seems to have the fascination with men - NOT YOU (Rene). So I TOO am wondering the same thing here.. I question no ones sexuality here except BIG ASS er I mean BIG AL's. I don't hear anyone else singing the Pork Butt song.. I bet his room is full of Porky the pig and Miss Piggy pictures and stuffed animals. He probably has a stuffed animal of each and rubs it on his dong too! The only wet dreams here are Big Ass er I mean Big AL doing Miss Piggy. Probably the only thing that will give him any attention sexually.

DID I see someone say this yo yo BIG ASS er Al was in the U.K.? Hmmmm...
Well, we know that they had Mad Cow disease. Is there now a Mad Porker
disease? Big Ass er Al eating too much of it? Maybe it is localized to his
home.

We're talking life of the universe now using more computers than the
number of atoms in the big bang!

It's rather of academic interest to cryptologists to argue much but
essentially only intellectually about cryptology in here.

The mention of the US military SINCGARS family might be a more
practical homebrew application of actual R/Ts that might be built using
FHSS or Frequency-Hopping Spread Spectrum. The US military has
over a decade of operational experience with FHSS in the field, to the
severe environment experienced by the military...with a lot of success.
The mode works very well.

The problem is that the mode may not be within the various adminstration
allocations for amateur radio. However, that should not prohibit bench
testing and simulation of links that do not radiate RF. Another problem is
that the FHSS now used by the military is definitely not the conventional
narrowband, one-user, single-modulation type "traditional" in amateur
radio use.

However, SINCGARS is definitely not a wideband modulation spectrum
hog such as with DSSS or Direct Sequence Spread Spectrum common
on WLANs and newer cordless phones. FHSS can have thousands of
separate radio circuits operating in a relatively small bandwidth without
mutual interference...and with little interference to conventional modes
of communication. Wide bandwidth necessary to handle rapid frequency
jumping already exists in modern amateur transceivers...that is not any
real problem. Some means of synchronization and capture to get into a
circuit is an area ripe for experimentation. Super-accurate timebases
have already been worked up and shown on such sites as TAPR.

The concept of FHSS is intriguing in its possibilites for the future...if
only
enough wish to truly experiment in new things. Just some idle thoughts.

No, that is what Whit Diffie, R., S., and A, in "RSA" and
James Bidzos believe for solid mathematical reasons.

> everyone always thinks their codes
> are safe right up to the point that they are not safe.

That alone has nothing to do with the mathematical argument here,
and what is truly sad is that you simply don't understand the math.

I see you don't actually even KNOW the scale difference available
to the NSA. Example, please define "eleventy squillion".

Just as every other crypto expert has believed their system is safe and they
have always been wrong.

>
>
> > everyone always thinks their codes

I do understand the math. it is not unbreakable. everyone who thinks their
favorite crypto system is safe always quotes the math. Doenitzs crypto guys
quoted the math.

A fuck of a lot more than a bunch of PCs.

Now give some proof that the NSAs role is to 'frighten terrorists'.

Just like nobody could do the amount of computations needed to crack the
good admirals codes.

Yet they did. the ONLY constant in crypto is idiots like yourself being
proved wrong. always.

Porkbutt is the ex-WB2OTK Rich Whiten out of Easley, South Carolina, USA.

73

Frank K3EKO

==========

Yes, Porkbutt IS the ex operator so named. He made himself infamous during his years as an overbearing, selfish, and overpowered Ham op on 14.313.
Rich is not missed save by a few of his malingerers.
The band is a better place without him.

And Frankie, why can't you and Dan just get along? Yeah, Dan is garrulous, he is known to be a pain in the ass at times, but why promulgate it with your inane comments?
Do you take pleasure in needling Dan? Why?
Dan has his schedule full enough as it is...he has to deal with jammers and the likes of David Tolassi and Dumbass Donnie. There is no need for you, Frankie, to be tossing your two cents worth into the already confused foray.
Frankie...ever pull your dictionary off the shelf and read the definition of "maturity"? Perhaps you and Dan should both do so, but most of all, YOU should do so Frankie.

One thing still eludes me in all of this. Why the Hell are all of you guys so set on attacking Lloyd? He doesn't really upset the cart all that much, but yet you guys persist in attacking him at every turn. What gives? Is this a "pile-on" mentality whereby all you macho Ham geeks attack the weakest of the weak? Like sharks going for the scent of blood? Playground Bullies? Cowards? Pussies? Whassa matter? Lloyd doesn't use a pocket protector for his fifteen multi-colored ball-point pens? Doesn't wear his callsign on his baseball hat? Doesn't run around with six HT's on his belt? Doesn't have six antennas on his SUV?
Face it...look at all the posts allegedly made by Lloyd...there are many. You guys don't know the real Lloyd from the sock puppet Lloyds, nor do you care to find out, if you can.

Give Lloyd a break, whoever he is. It is beyond your areas of expertise to cull out the real Lloyd from the anonymous Lloyds.

Maybe one of these days you freaks can take off your aluminum helmets with the rubber duckies mounted on them and join the real world.

Frankie...stop messing with Dan. Change your diapers and move on....

Hmm, not very limiting. Atoms come significantly after the big bang.

Hi,

Can anyone point me to the web address of the company that sells extension leads for the HP141T/8553B/8552B spectrum analyser? I've 'googled' for a couple of days and failed to locate it although I know there is one out there. Better still, a source of the blue Cinch 24-way plugs and sockets to make-up my own.

73 de Joe, G3LLV

If you think that throwing money and machines at the problem will
crack a 2048 bit assymetric cipher, you nare a complete and utter
fool who knows nothing, I repeat *nothing* about encryption.

Hi Joe,

Try this URL:

http://www.glkinst.com/cables/hp_cables.htm

I bought a tracking generator cable from them a couple years ago. The quality was very good, but the cost was a bit less expensive then.

73,

Doenitz trusted the Czech engineer who built the Enigma.
Bad practice for a Nazi.
He didn't anticipate Colossus, which he SHOULD have if he had read
the papers of Konrad Zuse who had already submitted plans for a
general purpose tube computer to the Reich, after building slower
ones out of relays in his parents' front room using university
student labor, and another two for the Reich using telephone relays.
Those relay machines could have cracked some of the Enigma messages
by iteration WITHOUT being rebuilt 2000 times faster with tubes!

-----------------------------
Indeed we DO know PRECISELY the kind of computing power required,
it falls right out of the procedure of the RSA algorithm itself.
Anyone who has studied it can tell you to the Megaflop how much
and how long it takes statistically for a given key length.
```

Why are you still on about Doenitz? He didn't even DO any math.

> Yet they did. the ONLY constant in crypto is idiots like yourself being
> proved wrong. always.

You're blathering some mystical true-believerism that makes you
pitiful.

Poor Steve. RSA will be cracked well within the lifetime of the user. and
you know it.

And right.

2320. A PC sound card DSP shell, come and gettid

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-28 05:57:01 UTC
From: farhan@hotfoon.com
Message-ID: <8331b126.0309272157.5cc64599@posting.google.com>
Source record: 32187

driven by a desire to play around with the DSP stuff in EMRFD, i wrote a DSP shell similar to the one in the book for the PC sound card. The book has examples for a DSP card called EZ-LITE which costs quite some money (and it is not available in India, where I live).
A PC based DSP shell has the following benefits:

1) I have written this one for M$ Windoze (okay, okay, i know , i know...) But most of us have Windoze on our systems. That makes the shell more useful.

2) You can program and debug in C.
That means, you dont have to learn complexities of the DSP processors. You can use floating points directly to do your work. Pentium comes with a floating co-processor that is virutally idle all the time. Use can use visual studio or borland c++ to write your dsp applications.

3) it doesnt cost money!
i will shortly host it on sourceforge.net (pending approval). in the meantime, if you want to play with it, email me and i will send it in source form as an visual studio project. You should be able to compile it on your own.

- farhan

I just acquired the above radio, and am looking for some items for it. I'm looking for a service/tech manual for it (I need the pinout for the power connector), a programming cable and software. If someone has a link on this radio, I'd appreciate it. Google wasn't very helpful. Thanks in advance.

hello all,

in a recent move, (from my former estate) i found a bunch of
stuff i got from a radio shack "store cleaning" deal. alot of it is
leds and such, but i have several ic chips and was wanting to hear if
anyone is familiar with them and if so, could suggest some projects
for them. i am just gonna list what i have. if i have excess and
someone needs one, drop me a line. will gladly drop it in the mail.

8 74HCT163 presettable synchronous 4 bit binary counter
3 74HCT161 "
"
1 74HCT164 8-bit serial in/ parallel-out shift register
2 74HCT08 quad 2-input and gate
2 74HCT14 Hex inverting schmitt trigger
2 74HCT132 quad 2-input nand schmitt trigger
3 74HCT32 quad 2-input or gate
3 74HCT123 dual retriggerable monostable multivibrator with reset
1 74HCT138 3-8 line decoder/demultiplexer; inverting
1 74HCT00 quad2-input nand gate
4 74HCT02 quad 2-input nor gate

now, i am about to "wow" you out of the chair. i am limited in
the tech department (shameful, isn't it?) will entertain any use.

Hi Gary -- this group is OK but rec.radio.amateur.equipment
might get a better response.

Since you specified Tech license, I assume without code, your privileges
will be in the VHF/UHF
range. http://www.arrl.org/FandES/ead/classes.html

New HT's and mobiles run $135 or so, used ones for as low as $30
For reviews see eHam reviews http://www.eham.net/reviews/

For used gear see swap pages http://ac6v.com/swap.htm

Good luck on the test.

>am I in the right place to ask this question

Hi Gary, The best place to find out all this stuff would be the ARRL web site.
They have a lot of advice on how to get started.
My 2 cents, an excellent, used solid state HF Xcvr can be had for $300-$350.
Check Ham adds, EBAY, Hamfests ect. Tube rigs are even less, but they have
problems that a newbie would not know how to deal with. (drift, tube failure,
caps dry out ect.). A new low end solid state rig will run you $600-$800.
These do offer excellent performance compared to older rigs.
Once you have a rig, you will need a power supply and antenna. A good 12 VDC
@ 20 amps power supply is available now for less than $100. Once you have the
rig and PS, you will need an antenna.
The antenna system can run from nothing to thousands, depends on what you wish
to do with your ham ticket. Good luck.

Gary

What is right for you depends a lot on where you are and what your interests are.

As a tech licensee, you won't have access to the HF spectrum, so for now, you probably don't want to spend a ton of money on an HF rig. Of course, even that depends a lot on your plans and your situation. Perhaps dropping in the neighborhood of a grand for a radio that can cover VHF, and will allow you to listen to HF to spur you on to get your general is what it right for you. But for most people, it wouldn't be.

If your interest is public service, you may want to check your local ARES/RACES group and see what they use. If you want to chat with local folks, find your radio club, or check to see what repeaters are in your area. Then perhaps try to locate some folks to talk with. In some major cities you may find that 2 meters is so congested as to be almost useless, and if you are going to enjoy your first experiences, you want to get on 70cm. On the other hand, in much of the country, there is NO 70 cm activity to speak of. VHF and UHF are mostly local, so understanding what is happening in your area is important.

If you're really into the tecchie stuff, perhaps you want to try some of the more exotic modes. You will find QSOs few and far between, but there is a trememdous amount of excitement from that first satellite or EME contact.

Keep in mind that, as a tech, most of the activity you will see is local, so understanding what is happening in your area is a big deal. Also, on VHF, the radio is less important than the antenna, and especially, on how high it is. VHF is mostly line of sight, and the higher your antenna, the longer that line of sight.

..

In addition to checking ARRL reviews and other online sources, join a local ham club in your area. It really helps to be able to draw on a knowledge base in your local area.

Thats one way to keep HF less crowded.
Don't flame me, but IMHO, I don't see much rational for morse code
tests being a part of the HAM liscencing scheme. Aside from the above
statement.

If you wish to debate the test requirements, go to rec.radio.amateur.policy,
which is intended to discuss issues of this nature.

I don't know how much money you want to spend to start out. I'm selling my VHF rig if you're interested. If you're on a tight budget it will work well for you. If you have more money to spend, I suggest getting a dual-band 2m/70cm mobile.
My rig is currently at $20.50 on eBay. Read the auction page for full description.

Mike,

It won't be that way for long. ITU has made the requirement optional as
of last year.

This is a really good question. If you are really into building stuff, there is no reason why you can't build a rig. Recognize, though, that equipment for VHF/UHF is somewhat more difficult to construct than HF equipment. Still, if it's the highly technical aspect of the hobby that turns you on, there is no reason not to go after a homebrew station. Amateur radio is the only service (in the U.S.) where you are allowed to build and operate your own equipment, and many people do, especially folks that follow this newsgroup.

For any new ham, especially one interested in building, the Radio Amateur's Handbook must be the first purchase. Certainly, it bears significant study before going out and plunking down a lot of money for a rig.

> 8 74HCT163 presettable synchronous 4 bit binary counter
> 3 74HCT161 "

these are interesting chips, and they can be configured as
programmable dividers. first hook up a small oscillator using one of
the 74hc132. make sure that it oscillates at just about 1 hz or so. u
can hook up one of the several LEDs to watch it flash. then connect it
to the 74hc163 to see it count (you can see it using the LEDs).

once you have understood how the 74hc163 works, then you can drive it
with a higher frequency source (like a VCO). If you can get your hands
on 74hc74, you can hook up a phase-frequency detector too. read up the
chapter on oscillators in EMRFD to get a full-fledged PLL going. It is
educative, fun and also very useful thing to have around.

Greetings:

I am interested in finding a source for schematics and/or a kit for constructing a battery recharing unit.

I'm new to "homebrew". So kits and/or schematics with explicit directions is appreciated.

The battery pack I am looking to recharge is a collection of approx 40 1.5v NiMH cells for about 28V overall. In fact, any kits/plans/suggestion on making the battery pack itself would also be appreciated.

Thanks!!

Having that many cells in series is a bit of a challenge. By my math, it's about 2 dozen cells to get to 28 volts, so if you're looking for a tad more capacity then maybe 48 cells, 2 sets of 24. (NiMH cells are about 1.2 volts fully charged.)

In principle, it's pretty simple business to charge NiMH cells, just put a little more voltage on them than they normally produce, and limit the current. If you want to charge them fast, you need to monitor the temperature of the cells and manage that temperature. If you are patient, though, just charge them slowly and no need to watch the temperature.

However, when you get cells in series, slight differences between the cells will cause one cell to take more of the charge than others. Eventually, this leads to the failure of the battery, but for small numbers of cells, it's typically not a problem. With your 24 cells in a line that could be a problem, but again., if you charge them really slowly there's less need to be concerned.

In use, you need to have the 24 cells in series, but for charging, you might consider some sort of a scheme where there are fewer cells in series and more in parallel. When charging the cells in parallel keep in mind current limiting on each parallel branch individually, but that could allow you to use something a little more common as a voltage source, say the station supply or a 15 volt wall-wart. Older cell phone batteries used to use this sort of scheme, where the connector was arranged so that the batteries were connected to the charging connector differently than to the discharging connector.

2346. Motorola OCXO Spec's?

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-09-29 23:19:43 UTC
From: "Leland C. Scott" <no-spam@junk-mail.net>
Message-ID: <BqGcnSVlp56LI-WiXTWJiw@comcast.com>
Source record: 32262
Cross-posted to:
rec.radio.amateur.homebrew,sci.electronics.components,sci.electronics.equipment,sci.electronics.misc,sci.electronics.repair

I have a Motorola "High Stability Oscillator" module. It is marked model K1052A ASP06, and S/N 401033. There are three terminals on the top face of the case marked E1, E2, and E3. The module is about 4.5 inches long by 1.5 inches wide by 2 inches tall. The crystal in side the oven chamber, in a glass envelope, is marked 3.0000 MHz.

```
|-----------------------------------------------
--------------|
| (M) MOTOROLA
| <- Coarse freq adjust on side
| High Stability Oscillator
|
|
E1 E2 E3 |
| Model K1052A ASP06 () ()
() |
|
| <- Fine freq adjust on side
| Serial 401033
|
|-----------------------------------------------
--------------|
```

The "()" are feed-through wire connectors.

So far all I have figured out is that E1 is the 3 MHz output, E2 is the oscillator supply, and E3 is the oven controller supply. The module when I found it at the flea-market had E2 and E3 connected together.

When I powered up the module I get a 3 MHz sine wave output on E1 and the module does not draw any significant current until the voltage supply to E2 and E3 exceeds 15 VDC. At 18 VDC on E2 and E3 the module draws about 125 to 150 ma and I can the see the frequency of the oscillator start to drop as the module heats up. The power in to the module at this point would be about 2 watts which is similar to what the HP-10811 OXCO draws, which I do have data on. I get about 1.5 Vpk sinewave output on E1 at 3 MHz at the above supply voltage open circuit.

The course and fine frequency adjustments seem to work once the module heats up for a while too.

Right now I have no idea if the module is working correctly or not. Without any specifications or other data I can't tell if the oven controller is working right, what voltages should I be running the module at etc. I'm assuming it came out of an old Motorola radio test set or some kind of Motorola two-way radio system that required high frequency stability. There is a small chance it came out of some old Motorola manufactured military equipment judging by the gay paint on the Aluminum two part case. When I contacted Motorola they couldn't identify the module, it wasn't in their database! Does anybody have any data on this module they would like to share?

If it uses the common 723 type regulator, you should be able to
figure it out from the data sheet. National, (LM723) On-Semi, (MC1723)
and several other companies made the chip. If it is based on this part
you can find data sheets online with Google, or post the part number and
I can point you to the data sheet.

Be careful, NiMH batteries are more difficult to charge than this. There exists a charging algorithm for NiMH that is rather complex. You basically charge it as you stated, but when the current draw changes a certain way, you must detect it then charge at a different rate for a predetermined time. There are some IC controllers aware of this algorithm, so your homebrew charger may be best to employ one of these IC's...otherwise I suppose you could roll your own with a PIC or BASIC STAMP and the right monitoring hardware. WARNING: YOU CANNOT TRICKLE-CHARGE NIMH CELLS!

Good Luck.

The best thing to do is check the Texas Instruments (www.ti.com) AND Maxim (www.maxim-ic.com) websites. They have application notes with complete schematics and their chips incorporate the proper charging algorithm.

As Mike Terrell has noted, most linear power supplies are based upon the
National LM 723 regulator IC. I would highly suggest that you read.

In my experience, I have avoided Pyramid supplies due to questionable
component quality
and some design issues (adequate heat sink for rating).
Check the bridge rectifier, pass trasnsitors and IC723 regulator.

Dave Metz's WA0AUQ 1996 SEITS article. It provides you all the basic
information
to troubleshoot or rebuild a damaged LM 723 based supply.

Just don't bring it up on the .antenna group - they'll boil you in
oil.

FWIW, the ad says it works 80-10M, w/o a tuner, so I wonder if there
isn't a resistor at the feed point as well.

Dear Sir or Madam:

We would like to invite you to participate in the Amateur Science Information Survey (AMSIS). The AMSIS is being conducted by information professionals at the University of Tennessee. This anonymous survey is an attempt to determine where and how amateur scientists find information related to their scientific interests. The online survey takes approximately 10 minutes to fill out. The results of this survey will help libraries provide services and materials to better meet the diverse needs of amateur scientists. To take the survey please go to http://www.lib.utk.edu/cic/amsci/amscisurvey.htm.

Sincerely,

Travis Dolence

Lushy, Multi band verticals are described in the ARRL Handbook, ARRL
Antenna Book, and in the various ARRL Antenna Compendiums. Lots of designs.
Or better yet, design your own, not that difficult.
This question should be directed at the antenna group to get lots more
answers.

Fellow hams,
This upcoming February we will be holding a technician license preparation class. This class will be available (of course free of charge) to local CAP people, local sea cadetts, and any others wanting to obtain their no code technician class ham license. We held this class last year and helped prepare 16 out of 25 attendees to successfully complete their license test.

We would like to reward those who pass their test with a used copy of the ARRL handbook. If you have an extra copy of the handbook hanging around and would like to donate it, please drop me an e-mail at wn1b@k8uo.com. I will be willing to reimburse you for media rate postage.

Thanks for your consideration and 73. Scott, WN1B

Of course you can! I suspect you left off the word
"indefinitely".

I've been trickle charging NiMh's successfully for years.
A properly designed, time limited trickle charger works just
fine on NiMh. What you should not do is leave NiMh's on trickle
charge indefinitely. Some manufacturers claim you can leave NiMh's
on trickle charge for up to a year! See the following quotes:

"Charge your batteries fully, and then leave them in the charger
to maintain a continued full charge condition and your batteries
will always be ready for use. (Nexcell or GP brand NiMH batteries
can be left on trickle charge for up to a year with no damage to
the cells!)"
from: http://www.mahaenergy.com/download/mhc204freview.pdf

"Star Batteries sells only the highest quality NiMH rechargeable
batteries available. All of our batteries:

Meet or exceed their labeled mAh ratings.
Have a "button" top to fit perfectly into your device
Are compatible with "fast" chargers
Will accept a "trickle" charge without damaging your batteries"
from:http://shop.store.yahoo.com/starbattery/ne21mahaanir.html

"Fast Charging: All our NiMH series can be fast charged at rates
from 0.5C to 1C. Fast charge termination measures should be
employed. These include: Temperature Cut-Off (TCO), Rate-of-
temperature rise (dT/dt), negative Delta V (-dV). A timer
control set at 105% of nominal capacity can be used as an
additional protection.
For maximum capacity, a trickle charge can be applied after
fast charging. We recommend top-off trickle charging at 0.1C
for 2 hours or 0.2C for 1 hour."

Indeed they do, but xpyttl's caution about "long" serires trings
remains just as valid a concern with decent controller chips. They
generally have no way to sense the individual cell SOC differences,
and therefore treat the whole string in terms of per-cell-average
voltage etc.

Additionally, any attempt at charge termination using temperature
sensing (absolute temp limit or rate of change) is VERY difficult to
implement on long strings simply because you need to sense at several
points and theses controllers are invariably designed for a single
temp sensing input. Been there, done that in a string >10, and we
gave up. The only other feasible option is to use MULTIPLE charge
controllers, each treating (and sensing) a small part of the total
string. This is often not a cost-effective approach. Sometimes,
redefining/rethinking the requirement leads to alternative approaches,
such as shorter strings feeding switchmode DC-DC boost converters.

>Danny, can you give us a match/swr for each band? The antenna is
>supposed to not need matching.
>
>Brian

Brain,

According to the manual the antenna uses a 50 to 800 Ohm broadband matching transformer at the feed point. Assuming then that the antenna's feed point should be near the 800-Ohm figure I ran a sweep for 3.5, 7, 10.1, 14.2 and 28.5 MHz referencing a 800-Ohm impedance to calculate the SWR. I got the following results:

3.5 1.40:1
7.0 1.88:1
10.1 1.92:1
14.2 1.96:1
21.2 2.37:1
28.5 2.41:1

Those figures appear to be in close agreement with the manufacture's claim.

That said I feel that worrying about the SWR's effects on antenna operation is somewhat like worrying how well a car will run based on the amount of air pressure in the tires.

But that's not what the context is. The intent of the original
statement is clear that he is referring to his (Rich's) supporters.

"Rich is not missed save by a few of his malingerers."

Malingerers is clearly a noun. In the case you try to make, it would
be descriptive of his, what? supporters? apologists? In other words,
more like an adjective. Then what is it modifying? Nothing.

In other words, you are trying to convince us that the original poster
was saying that "Rich is not missed save by a few [people who feign
illness or inability]." Sorry, no sale.

I will concede that I've never heard promulgate used in that fashion.
Sue me. I will not concede, however, that given the whole text of the

definition (which refers to publishing laws or proclamations) that the original poster's use was appropriate, particularly in the context of the original post.

>In fact, "perpetuate" is another perfectly good synonym, contrary to the
>erroneous statement by "master language butcher" LRod.

Interesting propaganda technique there; citing a source and using actual material from it, then adding one's own thoughts in the same paragraph to give the impression one's own ideas are also from that source. Please cite any source in which "perpetuate" is a synonym to "promulgate." It's certainly not in the ones you used.

>Perhaps "LRod" would do well to consult a dictionary himself before
>attempting to correct someone else.

Just one? Why, you used at least two, neither of them mainstream, to try and make your point. Something wrong with http://www.m-w.com ?

>Instead of the intended result, LRod, you now have your foot firmly planted
>in your own mouth.

I know you'd like to think so, but, I refer you to Mark Twain's essay "Fenimore Cooper's Literary Offenses" in which he describes, with a musical metaphor, Cooper's misuse of words as "sharping and flatting" his way along. The vocabulary use in the original poster's message fell short in substantially the same way.

Danny, thanks for running the numbers. I appreciate it.

And feel free to drive your car w/o air pressure in your tires. Maybe
you've got the Presedential and Armored Car series tires. Since I
don't, I prefer air in my tires, and in my antennas, I prefer an SWR
somewhat below my transmitter's SWR protection circuit's limit.

Well, you're not locked. Did you measure the gain of theVCO? In other words, did you disconnect the tuning diode from the PLL and then plot the VCO's output frequency versus tuning voltage? You need this data to accurately calculate the loop components. Another item to look for is the Vcc supplu rails to the PLL and VCO. These need to be clean. Did you do a good job of de-coupling the supply to the PLL?

Regards,

KD0QO

I guess I choose a poor analogy regarding SWR. On my list SWR is the least of my worries as it is one of the easiest to fix. I would be much more interested in the antenna's pattern (launching the signal in a direction and angle I wish), what amount of gain it has at that direction/angle and what efficiency it operated at.

Back to the analogy of a car. I would be more interested in how the engine ran, transmission worked and so forth. A flat tire (read excessive SWR) is easy to fix but rebuilding an engine is another matter.

==========

It must not be forgotten the health of French nation has considerable improved since August. The undoubted evidence for this is a much reduced death rate amongst the elderly which will last for several years.

The same sort of statistics apply to other countries which suffered from the heatwave but didn't bother to publish them, ie., for political reasons they kept it secret.

The French government should be congratulated on its honesty as it should be on other matters of international interest and importance.

Vive la France ! Vive l'Europe !

Reg, G4FGQ

Hello, Reg

Well, I'm sure you'll get some flames on that comment, but it sure is nice to hear some honesty once in a while. I've read comments carried in news organizations some years ago. A number of Europeans were appalled by the number of homeless in the United States. Oh, some of the "conservatives" have broadcast a lot of hot air and some folks will call anyone disagreeing with their position "card - carrying - liberals", but the fact is there has to be some reasonable compromise to keep as many folks happy as possible. Also, it is necessary for any civilized nation to provide some level of support for those citizens unable to take care of themselves. Mind me, I am not saying that we are or are not doing that toady. However, it is fortunate that we have a very powerful weapon here. It is called the vote. If enough folks get upset, it will show despite the 30 second sound bites and handshaking LOL :)

I might inquire if you believe that the administration has been totally honest in its' appraisal of Iraq's weapons of mass destruction. Hmmm ... it may indeed be honest; it may not. All of the information is not in and I doubt it ever will be.

What's the difference? They both lied to their people so their invasion of Iraq would seem just.

What worries me is that in almost every country people are getting more and more anti-american.
Only 15 years ago most there was a normal mixture of positive and negative opinions, but it has become more and more negative, and since Bush 1 and 2 mentioning the word america to a non-US person generates a flood of negativity.
For most people that is, exeptions here and there, but what would be the reasons for that?
Personally I don't have such a primitive opinion, which is usualy just based on black and white thinking, but the situation as a whole worries me, I cannot see anything good coming out of it.

-Jeroen.

We are pretty bad at marketing ourselves. One of the other problems
is that in many areas of the world, people expect their politicians to
never be truthful, and to always have a secret agenda, where for the
most part, we consider this to be the abnormal state. Then end
result being, we tend to look at situations from a "best case scenario"
and the peoples of other countries tend to look at us from a "worst
case scenario".

Maybe it's something to do with posts like the original in this thread, congratulating the death of 14000 non-Americans. I assume the post was by an American?

Many if not all of the agreements are from Americans.

The thread has a very "We and them" nature to it.

Is this typical of American feeling?

I think the general view of America and Americans by many non-Americans is that of a nation full of (or least run by) selfish, arrogant people. I wonder why?

(I am not the type of person to cast judgement on an entire nation by my experiences of a few from that nation - this is the general feeling I have picked up from others)

Ben

<<

Maybe because - they are more like hard working, sacrificing, individualists, taking charge because (still) government limiting power or dictator doesn't punish them for succeesing (it does with taxes)?
Sure, the lazy ba$tards envy those who work, achieve and have.

What other country has helped so many in case of disasters and wars? Selfish, arrogant people?

Why there are so many people trying to immigrate to US? To learn to be selfish?

What do you expect Americans to do after their prime city was attacked by their own planes and 3000 people killed? Sit in the White House and be served by intern?

Looks like too much BS distorted propaganda is out there. Come over here and see with own eyes!

Yuri

2400. Receiving WWVB

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-10-03 21:39:10 UTC
From: Joel Kolstad <JKolstad71HatesSpam@Yahoo.Com>
Message-ID: <blkq9agbt1@news.oregonstate.edu>
Source record: 32117

I've been thinking about building a WWVB (time code on 60kHz) receiver, and wanted to get some suggestions for the architecture. Poking around the web some, I did find one receiver where the guy built a synchronous detector using a PLL and VCXO to phase-lock to the 60kHz carrier. Nice idea -- especially since he wanted the 60kHz carrier as a synchronization signal. However, I just want the time data... so... wouldn't it be easier to build a mixer at, e.g., 59kHz and then use an envelope detector to get a loud/quiet audible (1kHz) tone (WWVB reduces power by 10dB to signify 0 bits in its time code)? It seems to me that this approach avoids the need for the PLL and VCXO, which is a nice 'reduction' in complexity. Also, since I'll have a microcontroller around to decode the time code anyway, it can easily generate the 59kHz signal.

Thanks,
---Joel Kolstad

Entirely predictable, I'm afraid. It's the same here in England.
People tend to ascribe the national character of the people to that of
their leader. Most unfortunate. I personally think the American people
are great, but there's no doubt that W's foreign policy stance has
been outstandingly disastrous in all manner of areas, virtually right
from day 1. From a personal PoV., I'm sick of years of being
associated with Thatcher, Bliar etc. This may be a democracy, but that
only results in the least-worst choice of candidate being chosen to
'serve' (themselves, usually). Even Churchill admitted this.

Certainly British people at any rate are at greater risk from
terrorist attack than we ever were before this recent debacle. And
what was it for? A war fought on an entirely false premise. Our
so-called security services need shooting for their incompetence.

I think you will need a receiver with a narrow band pass. The phase locked scheme can help you get a very narrow band pass.

Another arrangement is use the 1 Khz as you planned and use a FFT program to get the signal out of the noise..

And maybe, at your location, the signal is strong enough that my concerns do not apply.

Ongoing programs had been found, active weaponized botulism
cultures and allegations (from the Iraqi scientists) that
some weapons had been moved to Syria, Iran, and even Jordan.

The sluggish and reticient behavior of the UN (caused by
the lack of real back-up for the 12yrs of UN edicts) gave
Saddam the opportunity to hide his programs. There is
even some indication that Saddam's people was even misleading
Saddam himself (alas, you probably don't get all of the
information about the weapons search.)

The entire world believed in the WMD issue (including even
the evil French regime), but didn't see the WMDs as a threat
(because they would be directed towards the US and Israel.)
The Islamist constitutency in France (and Germany), the
stronger and stronger anti-Jewish attitudes and the fear
from old Europe due to their own impotency has indeed caused
serious problems.

Just because Saddam didn't like America doesn't make him
your friend. You seem to assume that anything anti-america
is good. Remember: it is Europe who had drifted far far
left, while IKE/JFK arent' that policy-wise very different
from Clinton/GWB. It is leftist, socialist Europe that
has lost its way.

John

I think the world view of Britain and US will change if the people replace the current gov in their next election to show the world that it is not the view of most people in those countries.

Otherwise, it is hard to blame the world for beleiving the people of the two country are reflected by their leaders.

Actually, it would be good to see a change in government in France
to show that it isn't so anti-America. The slowdown of commerce
with France has been partially indicative of the American attitude.

Most of the truly egregious things that are ascribed to the
American government are either untrue or very dishonestly biased.

I played with that many, many moons ago. The bugaboo is local noise -- QRM from all kinds of devices running from mains power, switching, arcing, and sparking. The noise was lower late at night when more gadgets were off, which I'm sure is why the automatic clocks you can get now do their synchronizing late at night. So I suggest looking at each architechture for its noise immunity and how it responds when it does get a burst of noise. Absolute minimum bandwidth is an advantage from a noise standpoint, as long as it's not so narrow that it rings for too long when hit with an impulse. A PLL with long loop time constant might be a good idea, since it should maintain synchronization through a noise burst. Other than those generalities, I don't have much to offer. I built up a simple receiver long ago that allowed me to see the binary code on a scope, but only late at night. I never pursued perfecting it to the point where it would be reliable. WWVB increased its power between then and now, but it's probably still not a piece of cake.

Nonsense. If someone offered me a vacation in either of those countries, I'd be packed and ready to go in an hour. You criticize Germany, yet we're the ones (the United States & Allies, after WWII) that put constitutional restrictions on that country's military and its participation in foreign conflicts. France, when it dropped out of NATO decades ago, also swore off any participation in NATO and U.S. foreign conflicts. Both of those countries now have a several decade tradition of this, yet you seem surprised, even outraged, when they maintained that same tradition during our invasion of Iraq. Unlike some countries, they mean what they say. If you now want to punish them for that, go right ahead. But don't expect everyone else to be a party to it. I, for one, will never punish a country for choosing peace over war.

I get a good signal into central Florida these days. I could barely
pick them up before they replaced their antennas and upgraded the
transmitters. I could pick up the harmonics of the horizontal sweep of a
TV set over a half mile away, but WWVB was so weak it was wiped out by
power line noise and other VLF noise. Temic makes a single chip

reciever/decoder, but I don't know if it is available in small
quantities. I have the data sheets, but I have to look for them.

On September 12, 2001, after 3000 Americans were butchered by religious fanatics, thousands of French spontaneously, with heartfelt tears in their eyes, marched with American flags in sympathy. At France's urging, NATO immediately invoked, for the first time in its history, the clause of common defense.

Almost two years later, over 14,000 French, mostly aged and infirm, are felled by one of the worst extended summer heat waves of the last hundred years. Our glorious right wingnuts laughed and said it served 'em right.

I know this is off-topic, folks (my first, I think), but there was a time when you could be a conservative and a patriotic American without spouting dittohead trash or playing Newtball with foreign policy. The country would be better off if the real conservative, patriotic Americans left the John Bircher wingnuts in the gutter where they belong, and take their rightful place running the country and guiding America through some difficult times. If nothing else, after we're done alienating every potential customer in the world, who will we design for or sell to?

The entire world believed that the UN inspectors hadn't found any weapons of mass destruction, and didn't believe that an invasion would be justified until somebody found hard evidence of such weapons. Saddam was seen as a threat not just to Israel and the U.S. - Kuwait and Iran had every reason to be nervous on the basis of their experience, and there was a wide-spread feeling that the man was something of a bull in a china shop - but an invasion based on mere suspicion was felt to be much too dangerous a precedent to be sactioned.

> The Islamist constitutency in France (and Germany), the
> stronger and stronger anti-Jewish attitudes and the fear

Deep dark suspicions about American neo-colonialist behaviour also seems to have played a part.

> Just because Saddam didn't like America doesn't make him
> your friend.

Just because Saddam didn't like the Iranians, you adopted him as your friend, back in the 1980's. Bad move. Saddam didn't like any non-Arabs, and even with in the Arab world nobody seems to have regarded him as an attractive ally. His oil did have some fans though.

> You seem to assume that anything anti-american is good.

Why on earth do you think that?
Being against the ill-justified and premature invasion of Irak is not an anti-American attitude, nor a pro-Saddam attitude, no matter how much Dubbya would like to make these false associations.

Trotting around saying that those who aren't for us are against us is the tactic of a simple-minded bully. The real world is a little more complex - not that you seem to be equipped to appreciate this.

Yes, John - anything you say, John. Since your ideas of what constitutes leftist and socialist seem to be drawn from the texts of the John Birch Society, your opinions on the subject are difficult to relate to other people's.

The population of the USA is approximately 5 times the population of France.
The 14,000 deaths there would be equivalent of approximately 70,000 in the USA.
Makes one wonder about the capabilities of the government to aid its people in
times of distress.

I don't think it's fair to lump the Germans in the same bracket as the
French. I believe the Germans' objections were genuinely held. As for
France, OTOH, they have a long history of back-stabbing and
rug-pulling against Britain and the US in particular. I certainly
avoid buying French stuff wherever possible, I'm sorry to have to say.

There is still LOTS of indication that weapons are on other
sovereign territory. They might even be hiding in the
Saddamite countries of France or Germany!!! You make
the claim of 'no weapons', but you make that claim without
enough information. Your own media is well known to be anti
US biased and incomplete regarding the US and the Iraq issues.

This says that the US AND THE REST OF THE WORLD intelligence
agencies MIGHT have had erroneous conclusions. In the US, the CIA is
led by a Clinton appointee (for example.) There are SEVERAL
anecdotes of the CIA director RECENTLY being asked by BOTH
Gopers and Dems that Saddam has the weapons, and he said yes.
These acks had been made in PUBLIC. In the US, the CIA isn't
directly controlled or managed by the president, and is
well known to be center-leftist. This is a GOOD EXAMPLE of
incompetency on the left (and in numerous other intelligence
agencies in the world) that might have led us astray. Perhaps
we were having to rely on the intelligence assets from other
countries... (The current furor about the mistaken leak of the
name of an operative is obviously a smoke screen to hide the
possibility of additional CIA incompetency.)

Here in the US, it is our LEFTISTS who have weakened the human
intelligence assets, trying to rely almost 100% on electronic
means. It was the GOP-types who had preferred to keep a
traditional and more reliable intelligence establishment. (Refer
to the actions of the Church commission, Jimmuh Cartuh and
BJ Clinton.)

If we didn't find weapons, it is possible that France had helped Saddam hide them (either directly or indirectly.) Just like Usama residing in Pakistan, we cannot intrude far into Iran, Syria, France or Germany to find Saddam's assets. (There were significant indications prior to the war that France had been complicit in helping Saddam.) The ongoing supply of such assets from Germany, France and Russia shows a lack of honesty and consistency with diplomatic position. At least, the US had eventually learned that Saddam wasn't a good guy, but France selling highly enriched Uranium to Saddam was STUPID. (Yes, Chiraq and Saddam were REALLY good friends. This isn't the same as the diplomatic relationship that US had with Saddam.)

There is OBVIOUSLY a case of old, worn-out Europe choosing Saddam over the US, and the US populace is well aware of that matter.

>
> The entire world believed that the UN inspectors hadn't found any
> weapons of mass destruction, and didn't believe that an invasion would
> be justified until somebody found hard evidence of such weapons.
>
Most of the entire world had believed that there were WMDs in Iraq. Perhaps France knows that Iraq had WMDs, because they are still probably storing them :-).

The difference is that France/Germany didn't believe that they would be targeted by Iraq (or its assets.) There is also a history in old Europe of tolerating terror attacks instead of considering them to be against human rights and freedom. Those old Europe countries have showed NO real concern about the US, and are NOT consistent with its values associated with the rights of the citizenry to be free from terror attacks, and the world shouldn't be free of Saddamist tyrants. It is clear that old Europe has divorced itself from the west, and is more interested in the countries (and emmigrants) who will soon force more and more women to be veiled... (The problem already exists in France.) NATO with old Europe is truly dead, and it is time for the unrealistic countries of old Europe to grow up :-).

John

Hi

As a Brit I hear people's comments on the question of why is America unpopular. I think its important to appreciate that every country has its strengths and weaknesses. One of America's great strengths is its vigorous defence of democracy. Compare that with here where democracy is being dismantled and replaced by the EU, and people's basic rights to repair their own homes is being criminalised, yet very few seem sufficiently concerned to do anything about it.

This is what I hear from people re the US:

America is widely criticised for its failure to address energy efficiency /pollution issues, which is something European countries have put a great amount of work into. America is very rich materially, yet appears very wasteful.

There is also antisocialness in US society which seems to run across the board, and rules US penal, medical, and welfare policy, which are generally considered really backward here.

Finally there is the thug image that comes from the various wars. Vietnam was one, and the latest war is another. Rightly or wrongly, the war response to 911 is widely condemned as thuggery.

Now, I'm not going to stand here personally and say these views are right or wrong, I'm not even getting into it. And yes there are as many criticisms about Britain too, in various areas. I'm solely saying this is the common perception, these are the problem areas.

Regards, NT

That extraordinary pollution I see over France while standing atop a
German hill is US pollution? I don't think so.

For US industry we are requiring lots of pollution control systems,
but we move slowly and carefully for two reasons: (1) avoiding
economic damage as we proceed, and (2) carefully examining the
side-effects... some *theories* about global warming are pure
socialist BS!

Hell, we give away the world in welfare. Penal, yep we have some
backward ideas about punishment rather than rehabilitation. Medical
is the best in the world, but costs are screwed up by the insurance
system.

I would suggest using a shielded loop antenna to help with the local noise problem.
The loop is directional so it could be oriented to reduce at least one source of noise.

Are their any dual tubes that are made for batterys? I would relly like a screen grid and triode in the same tube. However two triodes will work if I can't get what I want.

I thought the reason WWVB was so low down in the spectrum was so propagation was fairly constant.

In fact no I didn't have to unsolder anything. The
whole oscillator is built
in a two part cast Aluminum case held together
with a bunch of screws. The two case sections have
a rubber gasket to seal out liquids. The section
where the crystal is located is made out of copper
surrounded by a stiff foam filling. The top half
of the case also has a section made out of copper
that "just" fits inside of the bottom section like
two pieces of telescoping pipe.

> Saddamite countries of France or Germany!!!

Dream on.

> You make the claim of 'no weapons', but you make that claim without
> enough information.

The claim was merely "no weapons yet" - I'm not in any position to
predict that you won't find weapons eventually. But six months is
quite a while to be searching for weapons that Blair claimed could be
brought to bear in less than an hour.

> Your own media is well known to be anti-US biased and incomplete regarding the US and the
Iraq issues.

Only "anti-US biased" when compared with your hyper-patriotic
collection of yes-men.

Have you any evidence to support the claim about "incomplete"
reporting? Your ignorance of the anti-Shah component of the support
for Khomeni's revolution suggests some incompleteness in the
information that *you* have to work with.

<snipped party partisan rant>

> If we didn't find weapons, it is possible that France had helped
> Saddam hide them (either directly or indirectly.)

All things are possible, but this is pretty unlikely. Have you any
evidence for this, over and above the recent US anti-French paranoia?

> Just like Usama residing in Pakistan, we cannot intrude far into Iran,
> Syria, France or Germany to find Saddam's assets.

Nor could Saddam, to get them back if he needed them. This is a pretty
improbable scenario - you really are scraping the bottom of the barrel
here.

> (There were significant indications prior to the war that France had been
> complicit in helping Saddam.) The ongoing supply of such
> assets from Germany, France and Russia shows a lack of honesty
> and consistency with diplomatic position. At least, the US had
> eventually learned that Saddam wasn't a good guy, but France
> selling highly enriched Uranium to Saddam was STUPID. (Yes,
> Chiraq and Saddam were REALLY good friends. This isn't the same
> as the diplomatic relationship that US had with Saddam.)

The difference was minimal until Saddam invaded Kuwait, which is a
US/UK puppet state, and not a French one.

> There is OBVIOUSLY a case of old, worn-out Europe choosing Saddam
> over the US, and the US populace is well aware of that matter.

Old, worn-out Europe - as I've mentioned before - didn't think that
intelligence agency fantasies about weapons of mass destruction in
Irak were an adequate justification for an invasion, mainly because
any land-hungry government can set their secret service to producing
such fanatasies as an ostensible justification for an invasion
actually motivated by - for instance - a thirst for oil.

> > The entire world believed that the UN inspectors hadn't found any
> > weapons of mass destruction, and didn't believe that an invasion would
> > be justified until somebody found hard evidence of such weapons.
>
> Most of the entire world had believed that there were WMDs in Iraq.

The evidence availabe at the moment says that those who did believe
this were wrong, and that the UN weapons inspectors were right.

> Perhaps France knows that Iraq had WMDs, because they are still
> probably storing them :-).

And your evidence for this claim is?

> The difference is that France/Germany didn't believe that they
> would be targeted by Iraq (or its assets.)

They didn't believe that either the US or Israel would be targeted
either, since they seem to have been of the opinion that the weapons
didn't actually exist.

> There is also a history in old Europe of tolerating terror attacks instead of
> considering them to be against human rights and freedom.

And your evidence for this absurd claim is?

> Those old Europe countries have showed NO real concern about the US, and
> are NOT consistent with its values associated with the rights
> of the citizenry to be free from terror attacks, and the world
> shouldn't be free of Saddamist tyrants.

There is no evidence that Saddam had the means to set up a terrorist attack anywhere more than about 150km away from Irak, and no evidence that he was planning to acquire such means in the immediate future - before the UN weapons inspectors had had a chance to go through the country with a fine tooth comb.

Your concern about terrorist attacks originated by Saddam Hussein is a paranoid fancy. Dubbya's claims about the threat he posed were simply wrong - old Europe didn't believe them, and a lot of your intelligence community seem to have been pretty skeptical as well.

> It is clear that old Europe
> has divorced itself from the west, and is more interested in
> the countries (and emmigrants) who will soon force more and more
> women to be veiled... (The problem already exists in France.)
> NATO with old Europe is truly dead, and it is time for the
> unrealistic countries of old Europe to grow up :-).

As opposed to the "realistic" US who have spent tens of billions of dollars on an invasion to protect themselves from a non-threat.

The - irrelevant - point about Muslim women wearing head-scarves and veils in Europe is yet another example of your capacity to grasp the wrong end of the stick.

Quite a few orthodox Muslim women do wear head-scarves in public in Europe - it isn't an uncommon sight on the street in Nijmegen. Some throttle-bottom educators and employers have objected to the wearing of the head-scarf indoors, and have been given short lessons in religious tolerance.

A few hyper-orthodox women go around fully veiled, in the burqa. This is usually tolerated, in jobs not involving person-to-person communication, but educators and employers do have the right to ban it where hiding the face compromises essential communication, as has been established in the courts.

There are social and family pressures on Muslim women, and women who are members of Muslim families, to conform to Muslim practice. If this gets to the point of daughter-bashing, it is dealt with, like any other form of intra-family violence - none too well.

There are more serious problems with female circumcision - amongst Muslims from some African countries - and with female education and emmancipation. Several Turkish and Morrocan fathers have murdered

their daughters "to save the family honour".

The US has to deal with similar sorts of problems within its own minority populations.

Quite what point you thought you were making about Europe escapes me.

Hi all.

This may seem like a fairly basic question. But here we go!

I want to performance test a 436MHz high gain antenna. My plan is to construct a simple dipole with a 1:1 balun for 436MHz as a reference antenna and construct another dipole with a 1:1 balun to receive the test signal, measure it with a diode detector and a milli-amp meter (field strength meter) at the shack. Do the calculation and have the antenna gain.
This seems to me to be fairly straight forward, but has anyone carried out similar measurements and concur with the approach or are there are there traps and pit falls that I need to be aware of. Or is their simply a better way?

Cheers

At 60 kHz, there shouldn't be any difference between daytime and
nighttime propagation. Certainly the ionosphere isn't involved.

You may want to use a small directional antenna on both ends. The ARRL
handbook gives a standard refferance gain antenna that you can use on the
end that you are going to replace with the antenna you are building. The
antenna is suspose to have a certain ammount of gain if constructed
exectally as given.
The directiona antennas will help eliminate some reflections. Also make
sure they are far enough apart to be out of the near field.

In 1991 we found nuclear separators, weaponized botulism and anthrax,
so how were we to imagine that Saddam had decided to go pure Plutocrat
after '91 and just do nothing but build himself more palaces and leave
off wasting his oil wealth on anything we would bomb?? He didn't
foresee 9/11 or he might have done otherwise! There was no good way
to know after he ejected the inspectors, it was a totally legitimate
expectation.

That was only among Islamics who felt magically dirtied by infidels
on their real estate. Irrelevant. The 9/11 episode gave us the right
to go turn the Islamic world upside down and shake it till everything
falls out. Tough shit if Europe imagines downtown Frankfurt wouldn't
be next if they didn't suck up to the Islamic squeamishness. The next
thing if we hadn't done it would have been the Taliban in 6 nations,
not just one, and trying to tell Europe what not to export to them!

It's a patent fact.

That the world is complex is irrelevant, when people we hadn't invaded
decide to bomb us with airliners. We SHOULD have nuked several nations,
or at least blackmailed them into turning over everyone we could think
of for trial, or else!

It is very, very obvious that namecalling without any factual
basis (e.g. forgetting to realize that the US has stayed relatively
centrist since the 1950's), my own views are quite centrist.

Given the fact that if you look at the politics of JFK and compare
with GWB, you'll find that they are relatively similar when
compared with the far-left of the screwed up far-leftist European
parties who incredibly have some influence there!!!

There has DEFINITELY been a far-leftist drift in EU, and an ongoing
anti-America and American sentiment in Europe, only recently
becoming extremely obvious from the US standpoint. Frankly,
the anti-America bias has been strong since the 1950's. It
is rather dishonest (or ignorant) to claim that GWB had caused it.

We just made a range dipole for 900 MHz. The balun we ordered from
Minicircuits (pay careful attention to pinouts) was a 1:1. It resonated
well once we took into account that the polyethelene mounting block
imparted a velocity factor which shortened the rods slightly.

Take a look at the 3A8GT. It's a filamentary diode, triode and pentode on
an octal base, with a grid cap for the pentode. Data may be found at these
links:

Didn't it take nearly four months just to find the bulk of the Iraqi Air
Force buried in the desert?!?!
I would think items far smaller in size and number will be much harder to
find.

But 'brought to bear in less than an hour' was obviously wrong.

> > Your own media is well known to be anti-US biased and incomplete
regarding the US and the Iraq issues.
>
> Only "anti-US biased" when compared with your hyper-patriotic
> collection of yes-men.

hyper-patriotic collection of yes-men? Doesn't exactly describe the
anti-Bush CNN.

Something interesting -- I watched the same article on both Fox News and
France 2. It was about a couple weeks after completion of the main fighting
when Fellujah first started becoming a problem point. Both Fox and France 2
had the exact same video and audio feed. The article started by discussing
how many Iraqi's were killed (of course - death and destruction always start
an article). The feed then started talking to soldiers to explain how this
situation came about - the soldiers explained how they returned fire toward
where an RPG attack came from and they actually nailed the instigators. The
France 2 news broke off just before this point and instead of the
explaination - the France 2 news just adlibed how this was "just another
example of another unprovoked attack by the occupiers".

Now doesn't this sound just a little like anti-US biased reporting? Maybe
just a little?

>
> Have you any evidence to support the claim about "incomplete"
> reporting?

To me - that was definitely "incomplete" reporting on the part of France 2. And that report was watched - and believed - by how many French citizens?

...

>
> There is no evidence that Saddam had the means to set up a terrorist
> attack anywhere more than about 150km away from Irak, and no evidence
> that he was planning to acquire such means in the immediate future -
> before the UN weapons inspectors had had a chance to go through the
> country with a fine tooth comb.

Fine tooth comb?!?! The Iraqi's knew every move the inspectors were making - in advance. And when the inspectors did try to surprise them - the Iraqis always had a means to block or thwart the surprise inspection. Such as staged traffic accidents blocking roads, etc. Many of the inspectors were commenting on the choice of hotel the UN was using after the war. They were talking about the staff of that hotel being entirely employed by Saddam's secret police... even the maids.

Actually, now NK is admitting that Saddam was trying to acquire long range missles from them. NK and Sadam reached an agreement in 1999 for long range missles but NK never delivered saying they were being too closely watched by the Americans and that it would be too difficult to smuggle them into Iraq.

Different story for the French, though. How about the interesting item from the Polish military this week. They found several anti-aircraft missles in Iraq this week. Not just any anti-aircraft missles - these were made by France and had 2003 date codes on them!

Regardless -- the subject line of this conversation is simply awful. How can anybody possibly be rejoiceful with a subject such as that?

2440. Newbie homebrew qrp question; nobody hears me

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-10-05 04:42:11 UTC
From: XJohn_S_Sandin@osca.state.mo.us
Message-ID: <3f7f9c6f.2726998@news.kcnet.com>
Source record: 32057

I am a new technician with code privileges. I built the following CW transmitter for 40 meters:

http://cs.okanagan.bc.ca/ve7ouc/eng/kc6wdk-mirror/transmitter2.html

It's a solid state 3-watter, based on an article in QST in June 1967. I used a printed circuit board instead of wiring everything together directly, as the QST article suggests. So, there are many wires running from various parts mounted on the chassis to the circuit board.

I'm getting very little output. After tuning the transmitter, per the specs, and measuring the output using the method suggested by the author of the web page, I figure I'm getting 1 watt or less. I am running this into a dipole cut for 40 meters, which is 7 feet off the ground. I'm using fundamental frequency HC6/U crystals for 7110 and 7125 kHz. I've been trying for 2 weeks, at all hours of the day and night, and have had no indication that anyone hears me. I've called CQ, and I've attempted to answer CQ's. Nothing, after about 100 tries.

I know it's impossible for any of you to know exactly what's wrong, but I'd like to see what opinions I can glean here.

Is there any reason why I should use FT-243 crystals, as specified in the article and on the website? I used HC6/U crystals because they were easy to get.

One of the transistors (Q2) is supposed to be heat sinked. I have put a large homemeade heat sink on this, using plenty of heat sink grease, and it gets so hot I can barely touch it.

Also, the transmitter chirps a bit at the beginning of each transmission, but settles down after a few strokes of the key.

Many thanks for any help you can give.

We're headed more and more Democratic, and more and more Socialist,
we just don't have a history of calling it that. Your so-called
"centrism" and your imagination surrounding that, is merely rightwing
delusion that tries to ignore change.

Since I didn't claim that, you should post your ridiculous assertion
someplace else. Europe has been socialist since after the war, when
they decided we couldn't REALLY rebuild what we destroyed, and that
they could either own their own industries, or let us buy them out
with excessive aid.

(Before reading further -- note the following:
1) Chiraq personally committed the French government to the sale of
weapons grade Uranium. There was NO non-military purpose for the
sale of that specific material.
2) Chiraq and Saddam were personal friends, and had intermingled their
finances to help some of Chiraq's elections.)

The above are only a few of the public reasons why we couldn't trust
sanctions, because the French were complicit in support Saddam,
even after the beginning of operation Iraqi Freedom!!! The motivation
of the French government to support it's ex-friend (the US) was
nil.

It is very clear that much of the European media is hopelessly biased
and is likely to cause an unnecessary and inapropriate rift between
the US and the dysinformed populace of some of Europe. Alot of the
anti-Bush bias results from a self-fufilling mechanism in the European
press, which is stirring up hatred with occult hate-speech. (The
coinage of the term 'dysinformed' is meant to portray the horribly
corrupt and hopelessly distorted morass of molded propaganda that
passes for 'journalism' in France, Germany, lesser extent Britain,
and their co-horts Al Jazeera with too much AlQueda influence along
with simple dishonesty.)

" Given the dishonesty 'in-extremis' from some of the European press
" against the US, it really does create an impression of deep, committed
" visceral evil growing in Europe. I am NOT religious, but the
" notion that the 'devil' is known as a 'great deceiver', it is

" clear that this level of deception is being perpetrated in Europe
" by obvious advocates of chaos and destruction of the Jews. (again,
" I am NOT religious, but there is too much incorrect/dishonest nonsense
" being told to the European public.)
"
There is maybe a religious war, instigated by Islamists and their
friends in the European governments and press, against the US and
Israel. For anyone who looks at the entire picture, with ANY
biblical religious sentiment, unless this situation normalizes,
it is very plausible that some of Europe is participating in the
ultimately wrong-headed cause.

It is incredible, but true, that much of the US/European rift
is artificially created by a press that is DEFINITELY misinforming
the European public about the US and about the situation in Iraq,
and even much of the information about Israel the so-called
Palestinians. (Without the anti-Jew terror attacks, the populace
within the boundaries of Israel -- however you define them) would
have been MUCH MUCH more comfortable, and the health of those
living under the Israeli state would be much better. The reason
for the current Arafat controlled attacks against Israel is the
ongoing intent to exterminate Israel and the Jews. France and
Germany seem to support this too strongly.

If Arafat (France and Germany) got their way, and Israel was
destroyed (or magically disappeared), then the standard of living
for their successors wouldn't be alot different from the current
non-Israelis. The best hope for the non-Israeli population is
for them to make peace with Israel, but the instigation of
hatred by Arafat, his friends, enabled by his supporters (France,
Germany) only let the situation fester. The problem is that
the people like Arafat tend to consider non-Islamic people to
almost be vermin, and they'd like to see the world be exclusive
to the Islamists (like in Mecca.)

It is clear that in this case, France is especially on the side
of anti-US exclusionism and a form of racism. They tend to
governmentally continue support people like Arafat, Saddam, etc.
The relationship between Chiraq and Saddam persisted long after
it was clear that he undeniably was quite evil. Also disgustingly,
some of the attacks and planning of the WTC attacks occurred
in Germany!!!

Alot of people forget that it was Chiraq himself who sold the
highly enriched weapons-grade Uranium to his true friend, Saddam.
Some parties in the French government tried to stop the sale, but
Chiraq had committed the French government. Saddam had absolutely
NO NON-MILITARY need to purchase the weapons grade material.

>
> To me - that was definitely "incomplete" reporting on the part of France 2.
> And that report was watched - and believed - by how many French citizens?

>
Such incedents of telling lies by incomplete reporting are quite common
in European press. Even the BBC has been loosing credibility. The
best way to extract information from the BBC materials is to try to
divine the raw facts, and understand that the editorial content is
seamlessly merged with the hard news.

IMO, the best way to get a completely accurate picture of the news
is to subscribe to at least one research site (perhaps more), and
study both the American and non-US press. The biggest fault with
the American press is that it tends to avoid depth, and we do have
some newspapers that have the European kind of bias (but to a lesser
degree of dishonesty.) The biggest fault with much (not all) of
the European press is that news about the US is now almost complete
negative propaganda against the US.

>
> Different story for the French, though. How about the interesting item from
> the Polish military this week. They found several anti-aircraft missles in
> Iraq this week. Not just any anti-aircraft missles - these were made by
> France and had 2003 date codes on them!
>
The issue of VERY RECENT French shipments of military gear to Iraq has
been reported in the American press in the last year. The reports
weren't 'front page' material, and required careful reading of the
news. It is quite true that France has been supporting Saddam,
EVEN AFTER THE BEGINNING OF THE IRAQI FREEDOM MISSION, and it is
also de-emphasized EVEN in the US media that Chiraq and Saddam
financially intermingled their funds to help Chiraq's election
funding. Some of this info has even been de-emphasized in the US
so as to avoid even stronger anti-French sentiment.

The judgement that France (and Germany) had been disloyal is actually
overly kind, but it is more accurate that they were acting as
enemy powers. It is much more reasonable for Russia to have had
continuing dealings with Iraq (even though they also violated
the Iraq sanctions), but it is astounding that France had been
so very incredibly (secularly) evil. The disgusting ongoing support
by France/Germany of the murderous Saddam has absolutely no
excuse.

>
> Regardless -- the subject line of this conversation is simply awful. How
> can anybody possibly be rejoiceful with a subject such as that?
>
I agree that the subject line is awful, but it should be a wakeup
call for France that they have some serious problems. Subject line
changed to be more factually correct and better describe the
discussion.

At least, when/if there would be a large US immigrant community
in France, (little real reason to join a regressing, devolving society

and culture -- so a middle class US immigrant community would be miniscule) in France, we wouldn't essentially
force French women in 'our' ghetto to wear a veil. The French obviously prefer the style of living as provided by Islamists and anti-American socialist (Vichy/Nazi derivative) dictator (Baathist) style of living. This does follow from the extremely strong anti-Semitism strengthening in those devolving societies.

In reality, most of the 'fear' that has been genned up in France/Germany against the US is a dangerously far-left wing scheme to try to discredit the centrist (non far left wing) US government. (Arguments about the US being far-right are specious, because our government is little different, actually more left-wing than the government during the John F Kennedy presidency.)

The governments who had diverged from centrism are DEFINITELY the Europeans.

John

Remember, you just admitted that there are changes towards leftism
and socialism. You don't disagree with my position that it is Europe
that is moving farther left (into the abyss.) Maybe you miss my
statement (perhaps in another message) that the US has drifted a
LITTLE leftwards, but not nearly as far cockeyed left as Europe.

Moving further socialist and creating command economies is
frought with silly situations like a lack of Doctors when they
are needed most -- because they are all on vacation at the same
time!!! :-).

You seem to have a habit of 'namecalling' while essentially
agreeing with me. It seems to hurt you that I am correct,
quite centrist, and disgusted by both the far right and
the far left.

There seems to be a serious fear on the far-far left that
their dirty secret of wrong headedness will be found out :-).

Don't forget the daytime LF/MF attenuation in the D-layer, by
preventing it from reaching the E-layer, which sets the LUF (Lowest
Usable Frequency). At night, the D-layer disappears, thus, the signal
can reflect from the E or F layer.

At least the 77,5 kHz Maiflingen standard time transmitter in Germany
is usable to about 2000 .. 2500 km from the transmitter during the
night at least in the winter. However, during the summer nights, the D
layer is in constant sunlight all night nearly 1000 km south of the
arctic circle, which may explain the worse conditions during summer
night, but of course the number of lightnings is also higher during
the summer, increasing the band noise.

I've done it on 1296MHz in a similar way. However I borrowed a
calibrated step attenuator and took the difference in readings between
the reference dipole and the antenna under test as the gain for the same
detector reading to avoid nonlinearities. You can also measure antenna
gain using sun noise on 70cm, but that's a bit trickier.

There are a lot of factors that can potentially affect measurements. The first and most obvious is impedance matching, which has to be done to extract the maximum possible power from the antennas (assuming that this is what you'll be doing when actually using the antenna) and delivering a known amount of power to each. Another is to make sure the feedlines aren't radiating or picking up signals, by using proper baluns, which you've mentioned. Move the feedlines around and change their lengths, making sure the results don't change. If they do, your baluns aren't adequate. If you want quantitative measurements, you'll have to carefully calibrate your signal strength meter at the power level involved. Don't make assumptions about its linearity. Better yet would be to carefully match the antennas to 50 ohms, then insert a step attenuator in series with the Yagi in the 50 ohm environment and increase the attenuation until it reads the same as the dipole. That way, the FS meter linearity is immaterial (although the attenuator accuracy is important). Then there's the possibility of signals radiated off the back of the dipole being reflected from near or distant objects which would affect the dipole's measured field strength more than it would the Yagi's. The different widths of the forward lobes can also cause unequal reflections. Although reflections can affect the forward gain up to several dB, their impact on nulls or front/back measurements is likely to be greater.

I'd do a couple of things. One is to build an NBS reference Yagi which is easy to construct and has a well known and documented gain. It's also easy to model. Modern modeling programs do very well with full size Yagis. Measure this on your range and verify that the measurements agree with its known properties. Another check would be to rotate the dipole and see if its pattern is what it should be. And rotate the NBS Yagi and verify that its pattern matches modeled results. Only after doing those tests would I have reasonable confidence in other measurements made with similar types of antennas.

Several comments ....

When your output is a LOT different than you expect, likely there is something wrong. Worse, there's a good chance that a lot of your energy is being transmitted where you don't expect.

One thing that I found helpful on my first homebrew adventure was to model any circuits that didn't seem to be quite right in PSpice. It's tedious, but it helped me immensely in understanding what's going on.

Secondly, a 40 meter antenna 7 feet off the ground is going to radiate pretty much straight up. That means that the only time any of your energy will get back to the ground is when the flux is very high, something that is happening less and less often. Worse, 40 meters is pretty noisy, and the old novice segments really not all that heavily occupied, so not getting a response right away isn't all that surprising.

If your output transistor is getting really hot you probably want to revisit your heat sink. If you have, or can borrow, a scope, take a look around and make sure that circuit is doing what you want. The heat could be telling you that a lot of your energy is being spent in parasitics. Presuming you have filtering after this transistor, that could be related to your low output, as well.

If you have, or can borrow, a general coverage receiver, listen for your transmitter on your fundamental, and on the harmonic frequencies, especially the odd harmonics. You probably will be able to hear your transmitter on 21.330, but it should be a LOT weaker. If it isn't, you have a problem.

Finally, I would try to find someone local (line of sight, say 10-20 miles if it's reasonably flat) and arrange a schedule. This won't take any propagation and it will give you some idea that your transmitter is working. Recognize that locals are often a lot weaker on 40 than stations more distant, but if there are huge issues then perhaps this will uncover them.

Finally the chirp - get a fat wire from your power supply to the radio. Also, make sure that the power path to the oscillator is very low resistance. It doesn't take much voltage change to shift the oscillator frequency, and there is a huge inrush of current on key down, so good old E=IR tells you that with a big I it doesn't take much R!

Hope this helps...

..

I'm not at all an expert on propagation. So are you saying that propagation of 60 kHz signals is via ionospheric skip? E or F layer? I didn't think the LUF ever got anywhere near 60 kHz at any time.

I thought that NIST prefers a dipole antenna up to 1 GHz, and then a
waveguide-fed horn beyond that. I would think that a pyramidal horn would be
more predictable that a Yagi, and not unreasonably large, even for 400 MHz.
Plus, the construction is simpler, and the design is more robust over time
(i.e., it's easy to bend a Yagi element slightly, not enough to notice it,
but enough to shift performance).

Yes, that seems to be what they have arrainged for themselves. Ask the surviving adult children of any of these elderly victims of the heat wave, and they will be happy to lecture you about how uncivilized and irresponsible the Americans are with their widespread use of the dreaded *air-conditionining* process.

I would not be surprised to find myself being lectured to on this point while standing with one of them before the open coffin containing their deceased mother or father.

The French "government", which has painted itself into a corner by promising more entitlements than the French economy can possibly support, saw these deaths at least to some extent as a relief of their disability. Over 10,000 no longer productive French citizens would no longer be demanding the entitlements that had been so generously promised to them in their productive years by the compassionate, caring socialism that is so widely accepted and implemented there in Europe.

Yes, and since confirmed by ITN and the Daily Mail's most respected
war correspondent. All of which perfectly illustrates my earlier point
about the french being back-stabbing rug-pullers. But whereas their
treachery is normally confined to the political arena, their supply of
such weapons to a hostile country in time of war is a very much more
serious matter. Further proof - as if any were required - of their
long-standing resentment and hatred of the US and Britain.

How is this figure arrived at? How are you measuring it? 1W doesn't
sound much, but it can go a long way on 40M., given an efficient
antenna system with short, low-loss feeder and matched radiation
resistance.

> I am
>running this into a dipole cut for 40 meters, which is 7 feet off the

That's *way* too low! As you must know for any ariel, you gotta get
that thing up as high off the ground as you can and that's even more
important at low frequencies like 7Mhz.

Something's wrong, then. The heat dissipated in your final transistor
should equate to the output power at the antenna if the system is
matched properly. Sounds like your tranny's trying to dissipate rather
more than a Watt. Are you sure you don't have a feeder/matching
problem somewhere? Have you cut the ariel to the right length? Are you
using a balun? Have you tried a substitute balun?

Get another ham a couple of miles away from you to give you a signal
report. It might show up something useful.

Hi All

A member of my local club has recently acquired an Alinco DX-701 and is finding it to be of little use as a main station radio.

Can anyone tell me if this set, which is the HF only channelised version of the DX-70 (100W), can be converted to a more usual VFO type set.

There are various solder pads on the PCB which can be joined or not to enable various options. Unfortunately the manual I have does not detail the function of these.

Failing that has anyone got any ideas for making this a more useful set than it currently is, e.g. computer controlled scanning or such like.

Thanks

Alec Wood M1BNK

I'm trying to help out a gentleman locate a cabinet and knobs for a BC-348.
Any leads?

Thanks,

Evan

Hello Skipp,
Thank you for reply.
You wrote on Fri, 3 Oct 2003 18:06:57 +0000 (UTC):

Sst> I believe the Heathkit SB-1000 QSK board is similar and I have stored
Sst> copies of it over on http://sonic.ucdavis.edu
Sst> Look on the amateur radio page.

Yes, I know and already download sch of Heathkit SBA-2001-1, but it seems to me QSK-5 is not a full copy of Heathkit. PIN diodes is not similar, Heathkit has LM324, Ameritron - no. I would like to get exact copy of Ameritron sch.

Best regards,
Igor UN7GM

John,

I can't get your URL to bring anything up in my browser.

If your final Q is getting REAL hot upon keydown in a very short period of time, I'm guessing you have some circuit issues there.

I had a similar problem with a little Tuna Tin transmitter I built a couple years ago, my problem was my antenna was broken. It was not resonant on 7040, which was the crystal I had in the transmitter. It was way off. After I replaced the final a couple of times, I broke out a SWR meter and noticed the mismatch. A new dipole 15 minutes later did the trick.

I run a 40m 1/2 wave dipoe in the very top of my attic peak, so it's about 30 feet off the ground...which is pretty low for 40m anyway but I get out pretty well.

If you do not subscribe to QRP-L I suggest you try there for some answers. Some of the brightest low power folks in the world are there.

See: http://qrp.lehigh.edu/lists/qrp-l/

John,
Can you post a picture of your unit somewhere(top and bottom views) so we can see what the PCB & wiring layout looks like? Many times an improper layout can lead to parasitic oscillations that will raise DC power consumption without delivering RF on the proper frequency.

Mike,

Here is something to watch out for. I tried to measure the pattern for a 432 antenna. I had coax going from the shack to the transmit antenna, and another coax going to the receive antenna. I measured complete garbage for the pattern, until I realized that the receive antenna was picking up a signal any time it was aimed at the transmitter COAX. I fixed the problem by moving the signal source to be collocated with the transmit antenna.

One way to get accurate gain readings is to use the receive S meter and a calibrated attenuator. For instance, if with the reference antenna you need 15db of attenuation to get an S9 reading, and with the target antenna you need 27 db of attenuation to get S9, the gain of the target antenna is 27 - 15 = 12 db. Some S meters are more accurate for low signals; so, you might want to use something like S3 for a reference.

It's worth a try, John. But 7Mhz is practically DC these days so
strays and paracitics shouldn't be too much of a problem. One thing I
meant to suggest in my earlier post was that the OP should try
transmitting into a known good 50 ohm dummy load and seeing if his
final tranny still gets as hot. That ought to be a real good clue as
to whether he does have some probem with his matching/antenna/feedline
etc..

Wouldn't it be just a hoot if the truth that was uncovered was that
the deaths were due to the fact that they didn't have any freon thanks
to thier pet the UN having pushed it out existence for airconditioning,
and thier economy was too weak to support the purchasing of the
more expensive, politically correct refrigerants?

I think the french people must have weak blood
or something.. I just read another artical about the
heat wave and have found that for 2 weeks the
temperature exceeded 104 degrees F, and the
health minister says that his prolonged length
of time accounts for the deaths.. whether you accept
the figure of 3,000 or 14,000, that's STILL a lot
of deaths. I live here in Texas where we've had
summers exceeding 104 for over a month at a time;
if you include the heat index due to humidity close
to the coast, we've had weeks where the temperature
exceeded 115 degrees for several weeks at a time
(this summer was an exceptionally cool one; we didn't get
over 101 for more than a few days). Yet here we
haven't had 3,000 deaths from it and ESPECIALLY
we haven't had 14,000 deaths.

It really doesn't matter what frequency the application is, modern
transistors have good gain well into the UHF range and VHF parasitic
oscillations can occur even in an audio application

It doesnt quite work like that, unfortunately. We have 2 viable
political parties, and a lot of the people dont want either of them.
The landslide vote that put this present government into power was not
a vote of great support for them, as many seem to fondly imagine, it
was a vote _strongly against_ the previous lot. This is why there is
so much apathy among the people re politics today. When you dont like
either of them, what do you do?

Voltage is measured across my 50 ohm dummy load and rectified using a
.05 mfd ceramic disc cap and a 1N34A diode. Then I'm calculating
thusly:

Power = (Voltage x Voltage) / 50

I'm taking the author's word that this works for a ballpark estimate.
I'm measuring 7 volts across the load, maximum, which works out to 1
watt or less. I've verified that my meter is accurate.

We have a mess of power lines around the house, so it's hard to find a
spot to even get it 7 feet high in a straight line. I'm thinking
about trying it on the roof, which is about 20 feet high at the
highest point, and mabye angling it in the center.

>using a balun? Have you tried a substitute balun?

The length of each element is 32' 11", which I calculated for use at
7110 kHz. There's no balun; I'm using coax, the shield is connected
to one element and the center conductor is connected to the other.
The coax might be 75 ohm. Pretty soon I'll have RG-58 for the entire
run, but right now it's a mix of RG-6/U and RG-59/U.

I will try to do that sometime during the next day or so. The author
of the website says that the layout isn't critical, and his version of
the project works great. But when I look at the original QST article
and the photos of how they did it (all direct-wired), I'm amazed at
how simple they were able to keep the assembly. So now I'm wondering
why I bothered to use a printed circuit board in the first place.

The fact that the connection between the top of L2 and the base of Q2 is
marked as coax is probably a clue that layout is critical.

Perhaps. If I were going to measure a Yagi against a dipole, I'd first try measuring a Yagi with known gain against a dipole. You might prefer to measure a dipole relative to a dipole. I can't see what you'd learn from it, but each to his own.

Working people with one watt can be challenging, but certainly not impossible. In the course of a few years, I worked (and confirmed) all 50 states and 33 countries on 40 meters with about 1.5 watts output.

Your antenna height is a big handicap. 7 feet is severely low for a 40 meter antenna. While you'll still be able to hear stations just fine, it'll produce a very weak signal from an already weak transmitter. If there's any way possible, make the antenna higher. I'd strive for at least 30 feet if possible; higher than that is better yet. Another option is to use a vertical. With even a poor to moderate ground system -- even a couple of ground radials (more would be better) -- it'll do much better than the very low dipole.

A hot transistor combined with low output power makes me suspect that the transistor is either parasitically oscillating or trying to produce a lot of harmonic energy. That means that you could be producing only a tiny amount of power on the desired frequency -- much less than even a watt. Pull the antenna off your receiver and tune around. Does the signal from your rig sound hissy or hashy? Are the signals at harmonic frequencies as strong as or stronger than the signal at the desired frequency? Set up a sked with a ham that's a few miles away (whom you can locate through a local club), and have him tell you what your signal sounds like. Have him listen for harmonics, birdies, or other signs of instability.

Finally, you need to be aware that a crystal-controlled transmitter can be a big handicap these days. People don't often tune off their own frequency to listen, and they're likely to have a pretty narrow filter, so you're not likely to get a response unless you're lucky enough to be very close to their frequency. That said, your success rate should be higher when calling someone than when calling CQ, since people are more prone to respond to a weak signal calling them than to one calling CQ. But only if you're on their frequency so they can hear you. I couldn't get the link to the URL to work, so couldn't look at the transmitter schematic. However, after you get the other problems fixed, consider modifying the rig to VXO operation (where you're able to move the frequency a bit) if it's not already VXO.

There's no reason you can't substitute HC-6 crystals for FT-243 in a rig like this.

>
> Roy Lewallen, W7EL
>

Roy,

I believe that even at 60 kHz, propagation is within an earth-ionosphere waveguide, the height of which is controlled by the sun (60 km during daylight and 90 km during night).

Precise RF phase comparison is easy at these freqs because the phase stability of the path is excellent during all daylight conditions, but there is some random variation at night. It is best to avoid making measurements (of phase) while the path is only partly in daylight because of the diurnal shifts in phase as the sunrise-sunset terminator passes over the radio path (due to the changing height of the waveguide).

The U.S. VLF OMEGA navigation system, the old WWVL (now SK) on 20 kHz, MSF on 60 kHz, and WWVB on 60 kHz all suffer from these effects.

The circuit you describe should be delivering approximately the peak voltage, not RMS, so the formula is more like V X V / 100. At 7 volts peak, that means you're putting out around 1/2 watt. That's a lot below the 3 watt figure you mentioned, so you should track down why it's so much lower. Pay special care to the circuit components in the final transistor output (collector) circuit, and make sure the inductors are built as described and the components are connected correctly.

WELL, "kieren", whoever you are, I don't know where
all this went, I simply replied to a post in alt.radio.amatuer.policy;
if it went to other groups it was because the original post was
also cross-posted. I have no idea where all it went; the same
place the post did that I *replied* to. I guess you do not have
the mental capacity to figure out this was a reply, not an original
post.

If you do not like it, I guess you have a personal problem then,
do you not? I guess if you find this something distasteful, it would
seem to me the problem is on your end, not mine. Ignore the
message, don't read it, if you do not like it. Put me in your
killfile. Log off the internet and go read a book. Do something.

But do not bother posting such condescending messages ever again
you overinflated sense of self-worth, because I could care LESS.
Got it? are we clear?

Clint

(etc)

Range measurement of absolute antenna patterns and gains at VHF and above is tricky business due to reflections and other factors. For a bit of calibration, the FCC does not require measurement of the absolute gain of _ANY_ television or FM broadcast antenna, whether required by them to be directional, or not.

For broadcast purposes, the gain of an antenna for a given azimuth and elevation is the product of its normalized azimuth, and calculated elevation gains. See the slide presentation at http://rfry.org for more detail.

Hi Clint,

Do you really have no idea where your posts go? Wow, perhaps you *were*
aiming to post to alt.ego.biggots after all! I withdraw any inference I
made that you're xenophobic - "plain stupid" sounds more like it. I
apologise for that gross error; I meant you no offence.

The second para. causes me no concern, but I take issue with the third:
You say you "could care LESS" (I suspect you *meant* to say 'couldn't
care less' - an error that strengthens my case for your stupidity, by the
way). However by writing a detailed reply, you indicate that you DO
care...if you really didn't care, you wouldn't have lowered yourself to
responding to my post, you see? Get it?

Because you really don't care what I think, I'll assume you won't respond
to this & we can both leave the topic forthwith.

Enjoy.

Humble apologies to anyone reading this thread: I somehow doubt Clint's email address is valid and, deep down, I suspect he's not really able to drive that medium correctly anyhow.

Spleen vented.

He pointed that some countries in western Europe were quite socialist
in the 1950's. More recent socialist governments have abandoned many
of the socialist policies of that period - confiscatory income taxes
on high incomes and the nationalisation of the commanding heights of
the economy are no longer part of the socialist agenda, or at least no
longer part of the agenda of any party with a hope of forming a
government.

The proposition that Europe "is moving further to the left" can only
be validated by choosing a rather right-wing starting point - like the
Thatcher regime in the U.K.

> Maybe you miss my statement (perhaps in another message) that the US has

Nobody in Europe is creating command economies these days - they have
been tried and found wanting. "Managed free markets" are more the
flavour of the month. where the government intervenes to suppress the
free market's tendencies to indulge in boom and bust, or to degenerate
into monopolies, amongst a whole raft of other nasty habits.

The French habit of going on holiday en masse in August seems to
persist unchanged through right and left-wing governments - Australia
is now being run by as unprincipled a bunch of right-wing nitwits as
you could hope to see, and they still all seem to go on holiday in
January in much the same way. I don't think you can blame that
particular problem on your (imaginary) creeping socialism.

> You seem to have a habit of 'namecalling' while essentially

I can assure you that neither the far left (which I take to be
left-wingers with parlimentary representation, but no chance of power)
nor the far-far left (whose ideology would barely permit political
organisation, and that only of a shadowy and clandestine kind) are
represented on this user group.

Your information about the nature of their fears doesn't accord with
anything I've read about left-wing organisations in Europe. Could you
let us know where you learned this interesting (if implausible) fact?
And the identity (or identities) of the left wing organisation(s)
involved?

Bill Sloman, Nijmegen

Probably JEALOUSY, because America has a set of NUTS and is willing to
finally
go start doing something about this terroism crap... just like one time the
nations
of the world had to stand up to fight authoritarianism, now the enemy is
terrorism.

The gutless, whimpering social-hell nations of europe forgot that a policy
of appeasement
doesn't work and thinks that if they cow down and lick enough extreme
islamic
fundamentalist's boots, they'll start "being nice and quit blowing thier
people up".
Meanwhile more bombs in subways, more carbombs in innocent neighborhoods.

Cowardly nations of europe- GO ahead, keep burying your HEADS in the sand.
We're doing something about it now.

If you want to be a bunch of weak pansies, just stay out of our way and
we'll take
care of it.

You are right, you are insane.

There is hardley any existant demand for 'museum quality' Xmitter equipment.
I've tried to rid two of our stations of some quality RCA Xmitters when we
replaced them with Nautels.

We attempted to sell them to collecters, no go. No one wanted them for
anything other than back-up. One went for $500. the other for $575.

If you can get $2,900.00 then you found yourself a sucker.

ok guys and gals... you were great with the LED theory.... but NOW I need your help in finding a cheap replacement for an oxygen sensor. The part is from a Automotive engine analyzer that checks 4 types of gas, one of them being O2.... Its an MSA Oxygen sensor part number 472062. I found one company on the net who sells them for$60. Being un-employed that is to high!!! These are used in the afore mentioned automotive machine and in medical O2 sensors... I was hoping that someone worked in a Hospital or DR office and could get a used working one for cheap.....

Thanks in advance for what ever help you may be for this cheap homebrewer!!!!!

Bob in phx .

p.s. the entire test system is a bear ace II with dual trace scopes, 30 plus tests and emissions testing,,, what did I pay for it.... $10.00 (yep 10 bucks)....

Source record: 32012

For those interested in getting full and complete details of WWVB, go to:

http://www.boulder.nist.gov/timefreq/stations/wwvb.htm

That is the home page for the NIST radio stations and there is a link to
NIST's radio coverage every two hours or so during a 24 hour period
using small hemispere map projections of North and South America.

What I am personally interested in is a source for the direct conversion
of WWVB field strength from or to Volts per Meter to confirm the 60 KHz
loop antenna constructed a year ago here. I have a particular reason
since there is some shading effects of nearby-to-residence San Gabriel
Mountain range. Reception is fine, I'm just trying to tie others' numbers
of field strength into the equations for a magnetic loop.

Whats going on - why is everyone so down on the French! - and I thought in Amateur Radio the banned subjects were sex, politics, and religion - if you want to argue with the French government, go for it, but there seems a disturbing trend to abuse French amateurs (and everyone else) because of their government policy in not doing what the Americans want in getting bogged down in another Vietnam - and yes, the french can be and are frequently bloody minded, but unlike the rest of us, they are just more upfront about it.

Think about the high death rate in the current European summer, use the same intelligence you would have applied to get your amateur licence - and think what would happen in Texas if you have several weeks of below zero (-32 degrees F from memory) - people, especially the elderly, would be dying simply because their homes were not equipped to deal with such abnormal extremes of temperature.

The French elderly are becoming dehydrated, (as elderly people do, their feedback mechanism about the need for water stops working when they get old) and get no relief at night because it doesnt/didnt cool down, so they get very little rest. Keep this up for a while and people start to die. A simple explanation, no need to resort to "they are inferior to us" racist bigotry.....

Curiously, "Anti-Americanism" has always been ONLY visible from an
US standpoint, and not just recently.

I find it noteworthy that it is the very same people who are complaining
about European "Anti-Americanism" are the ones that spew hatred against
everything European (especially French) just because it's European,
whereas the ones accused of Anti-Americanism merely critizise American
policy. The only strong expression of "Anti" sentiment I see in this group
is a hatred against Europe, but so far no one has stooped so low as to
call it "Anti-Europeanism". That's probably because the anti-European
slurs are just a side effect of narrow-mindeness and stupidity and
therefore don't warrant coining a new term to name an old phenonomenon.

John,
I had a look. The outside cosmetics are very nice, but the internal wiring is kind of scary for RF. I suspect you have a lot of coupling between the wires that are bundled together. In a more ideal setup, the PCB would have been mounted directly on or very near to the two coils and tuning caps.

Here are my suggestions for troublehooting. Do them one at a time and see if any of them make a major difference:
1) Remove the lowpass filter and mearure the RF output again . Maybe the filter cutoff frequency is wrong.
2) Unbundle the wires and spread them apart. Does that improve anything?
3) Remove any interconnect wiring that isn't absolutely essential for RF operation. Strap the switch lines to their proper state on the PCB & remove lamp wiring. See if that improves things.
4) Measure the overall DC current and the DC current into the amplifier stage only. When the amplifier is driven properly, getting 3 watts RF out will require about 4-5 watts of DC into the final (Vfinal x Ifinal). If the current is much too low, check out whether the oscillator stage is driving it properly. If it's too high for the RF you're seeing, check the final stage tuning and possibility of an oscillation.

Good Luck,
Joe

One of the wonderful things about amateur radio is that there are so many facets to explore. Each of us finds his own favorites, but in my mind, there are few things in life as fun as building and operating your own equipment.

Your low pass filter leaps out at me. Typically, the coil windings are spread out over 80% of the toroid, rather than 20%. If, in fact, this was the intent of the low pass filter design, then your inductances could be quite a way off. Not only would this change the cutoff frequency of your LPF (raising it most probably, so not likely the direct cause of low output), but it would also change the impedance the transmitter sees. (I'm leaping to the conclusion here that the LPF is between the transmitter and the antenna). What this means is that the transmitter isn't seeing 50 ohms even if your antenna is resonant. This would result in the final heating, and could also favor the parasitics that I suspect we have going on here.

As you explore what's going on here, keep in mind that these things aren't magic, what they do is always goverened by the laws of physics. Validate by measurement that what you think is happening is, in fact, what is going on. You really don't need a ton of test equipment. Granted, lacking lots of gear, each measurement can be a bit of a project in itself, but once you have a DMM and have built an RF probe (about a buck's worth of parts), you can make pretty much any measurement if you think it through.

I was planning to use a coil wound on a ferrite bar core to reduce the overall size of the antenna, but the web does show people successfully using large 'air core' loops, as you've suggested. I was thinking of shielding the ferrite bar antenna by placing it in something along the lines of a copper pipe with the edge slitted, but apparently it might be bet to enclose the antenna in a U-shaped piece of metal, such that, oh, say, 1/4 of the broadside of the antenna is still exposed? I'm not sure why this should matter, though?

Roy,

Does one have to worry about elevation? Generally the gain at 0 degrees elevation is very low. Does this apply when the two antennas are facing each other in plain line of sight? should he raise the transmit antenna to say, 15 degrees above the receiving antennas?

Yes, your censored media does tend to cause problems for us.

So, this is a perfect example of the Europeans having a very poor
abililty to be self-reflective. Remember: it was Chiraq who had
intermingled funds with Saddam, and unnecessarily sold weapons
grade Uranium to him. Very little public exposure has been done
(in Europe because of soft censoring, and in the US to keep
anti-French/Chiraq fervor from being stronger.)

For poor judgment, it is easy to compare the laboratory samples of
materials that I could buy in the 1980s (provided by the US), while
weapons grade Uranium was sold by France. The purpose of the
laboratory samples of biological materials was just as likely
useful for constructive biological research. THERE WAS NO
OTHER PURPOSE for WEAPONS GRADE NUCLEAR MATERIALS that Chiraq
sold to Saddam. The lower grade Uranium would have been useful
for ANY large scale non-weapons purpose.

If you cannot see 'anti-americanism', then it would be good
for you to learn from less censored media about what has been
happening.

The gain at low elevation angles is low only if you're distant from the antenna, and ground reflection is taking place -- EZNEC's far field analysis assumptions don't apply to a typical antenna measurement setup. Low far field gain at low angles is due to interference between the direct radiation and radiation reflected from the ground. This can and does occur when measuring antennas which are relatively close, but not to the extent you see in idealized far field modeling results, where the antennas are effectively an infinite distance apart. I don't have a great deal of real experience in measuring antennas, but believe that the common practice is to try to put the antennas high and relatively close together. It shouldn't be difficult to get a pretty good idea of the amount of signal cancellation you'd get for a given height and spacing, by setting up and solving a pretty simple geometry/trigonometry problem. Or you could model the two antennas over ground at their proposed positions, with a source in the transmitting antenna and a matched load in the receiving antenna, and look at the power delivered to a load as the height and spacing are changed.

Fortunately, dipoles and moderate size Yagis have similar elevation patterns for at least moderate angles relative to straight-on. That means that the percentage of signal directed toward the ground and therefore arriving at the receive antenna as a reflection will be about the same for a reference dipole as for a test Yagi. So whatever attenuation occurs, it should be about the same for the two antennas. This wouldn't hold, though, for a very long Yagi or for high-angle reflections from antennas which are high and close together. It's one of the factors that make really good antenna measurements tricky.

Hey Fellow tinkerers and gadgeteers,

I have a bunch of vintage electronic, radio, TV and similar stuff, great for homebrew projects. Clearing out my dads stuff, he can't use it any more, and now it is your chance to find a bargain,

I have them listed on ebay, I will be adding even more next week. Have TV Tubes, meters, panel meters, power supplies, breadboards, you name it!

All of my auctions start at $1, no bull, no hidden reserve, etc.

The European media isn't all that thoroughly censored. During the run-off stage of the most recent French presidential elections, we were treated to the views of pro-Chirac (note the spelling) placards, urging the electors to vote for the crook (Chirac) rather than the thug (Le Pen). The Dutch news-readers enjoyed this immensely.

http://www.internationalist.org/nationalfront&strongstate0602.html

The odd thing about Chirac is that he isn't one of *your* right-wing crooks in the way that - for example - Belesconi seems to be. Presumably Le Pen - who is even more right wing - is more to your taste. Given Chirac's alleged pechant for taking bribes, it is difficult to understand why you couldn't get him on-side, with Blair and Aznar, for the invasion of Irak.

2517. Newbie homebrew qrp ....update

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-10-07 12:42:25 UTC
From: XJohn_S_Sandin@osca.state.mo.us
Message-ID: <3f82b1a9.195020@news.kcnet.com>
Source record: 32034

Regarding the 3-watt transmitter I'm building (and having trouble with), here's an update.

I removed the lowpass filter and loosened the wiring, and for a while it seemed to help. The transistor didn't get as hot. But the output stayed the same (less than 1 watt). But then I noticed, as I've noticed before, that the voltage measured at the dummy load doesn't always drop when the key is released. And the transistor stays hot even after the key activity has stopped.

I did as one poster suggested. I removed the antenna from my receiver, tuned around while transmitting, and discovered the following:
(Crystal is 7110 kHz)
at 3554 kHz, signal is S8
at 7110 kHz, signal is S6
at 14218 kHz, signal is S6
at 21326 kHz, signal is S7
at 28433 kHz, signal is S5

Even I can see that this isn't good. And the emitter of Q2 connects to the same trace as everything else that's grounded in the circuit, and it's not a very big trace.

I'm probably going to rebuild this rig, without the circuit board. Many thanks to all who gave me advice on this. Any further comments are also much appreciated.

I put the schematic on my website. The design calls for 28 VDC for a 5-watt output, but I am using 12, which is also ok according to the article.

Build it "ugly style" on an unbroken sheet of copper-clad board, and try
a ferrite bead or two in the base and/or emitter leads of the
transistors. The FAA and your local cellular-phone company will thank
you. :)

I didn't look at the pictures, but someone said something about long
leads to coils and maybe variables. Sometimes it makes sense to make
the circuit board used for the "ugly construction" the front panel, or
at least mount it flush with the front panel. Then, all the controls
can be mounted on the circuit board, near where they are connected and
with the actual shaft coming out the circuit board, yet they can be accessed
from the front panel.

Or mount the controls 90 degrees to the front panel, but again have
them mounted on the circuit board so the leads are short.

Clint
Would you be so kind to call those European nations by name, I am tired of
being told how anti american I am !

I am MSGT in the RDAF, have been in Cyprus, Gaza, Afghanistan, Kosova,
Bosnia I Herzegovina and have just got back from
Mosul Iraq (where I lost one of my best friends). I have been working
together with lot of US soldiers, terrific guys.

I am fighting terrorist like many other Danish soldiers, and many other
European Nations. Maybe we are a small nation, but we have
so many troops out there that compared to the nation size of US, it would
mean about 300.000 man. Which means the cost is extensive.
But we as nation means that this is the price we have to pay.

So Clint please call them by name.

Thanks Per OZ1EQC

I admit that we haven't seen much of John Woodgate recently, but you
are trying to fill a much-needed gap.

I must say that I did wonder about Chiraq/Iraq when I was looking at
your piece, but figured that a defective vocabulary was more likely
than a defective play on words, all things considered.

You were wrong, as usual. You don't even have a miniscule idea
as to how wrong headed you are...

Again, if you cannot see that the use of the name Chiraq isn't obvious, then perhaps your own perceptive skills are challenged by the wordplay?

John

Your heatsink (at least, I think it's the heatsink) is
inefficient (finless), and you mentioned using lots of
heat sink grease. You *can* have too much grease.
Putting in a bigger sink with fins and a small amount
of heatsink compound won't fix your problem - but it may
be a good idea, once you have fixed it.

The fact that the xsistor is heating up at least means that
the rig is "making power". If we assume that the power
it's making is RF at the right frequency, then suspect the
output circuit from the collector outwards up to and
including the antenna. And, with your antenna at 7 feet,
and fed by a questionable mix of coax, it may be the source
of the trouble.

Try feeding the rig into a good 50 ohm dummy load and see if
that allows the transistor to run cooler.

This seems to me to be a sure sign the amplifier transistor is oscillating on its own. In this circuit the code key doesn't interrupt the amplifier - if it's oscillating on its own, it will do so whether the key is closed or not.

What *frequency* is it oscillating at? Good question. (if I were you I'd try to get my hands on a 51-ohm or 47-ohm 2-watt resistor and use it in place of the antenna until you get the oscillation in the amplifier fixed. Unfortunately, simply replacing the antenna with the resistor *might* fix the oscillation! The antenna is essentially part of the circuit..)

I have my suspicion that the fact the leads for L1/L2 (the coils between the two transistors) and L3/L4 (the coils between the amplifier and the antenna) are long and close together may be your problem. You really need wires in RF circuits to be as short as possible. Maybe remove the connectors from the back of the box, put the coil sockets there, and put the *connectors* on top? I suspect the RF on the leads for L3 is being coupled into the leads for L2.

john,
a receiver will probably report all the harmonics of the crystal. so
that is not really a big deal. almost all the harmonics will also
sound pretty powerful and equal to each other in the HF receiver
because the recevier's AGC will boost the lowering outputs to a higher
level.
the output at 3.5mhz can be easily explained by a receiver shielding
deficiency. what i would really suggest to you is to TAKE CHARGE. i
mean, figure out exactly what is going and how.
do you have access to an oscilloscope? a single oscilloscope trace is
really worth a thousand blind trails. failing which,
i suggest that you should first make yourself some test instruments. i
would highly recommend a wavemeter. it requires about 5 components (a
couple more if you want to build a GDO-cum-wavemeter). A single coil
should cover most of the HF band of interest to you. then ...
rebuild the transmitter from scratch, keep everything at 50 ohms
impedance. refer to EMRFD for guidlines. then ...
don't push too much gain in each stage. It is actually easier to debug
and build a transmitter with more stages having lower gain than trying
to push maximum out of fewer components. finally ...
shoot for about 7 watts of output. An 80 cent IRF510 should easily
give you that much. use the wavemeter and the a power meter to measure
the harmonic outputs. But frankly even if you are pushing out 50% of
the energy in fundamentals, then political correctness aside, you
should be able to make contacts. QRP of single watters are best left
to old war horse like W7EL. it is tough for a novice to get through on
a single watt being rock-bound.
i would also suggest that you hook up with a ham down the block to be
able to monitor your signal. then another across the city ... then
another across the state...

Thanks again to all. I'm going to take charge of this problem first of all by rebuilding the project, using direct wiring, using the layout recommended by QST, June 1967. Using this method, I can fit everything into the just the lid section of my existing box and I won't have to remake the tube socket holes in a new chassis. Based on what everyone has said, I ought to get rid of all that loose wiring anyway, prior to making any tests with a scope, which I don't yet have. I want the thing to be well-constructed, to eliminate all that unpredictability we've been talking about. I will also use only my 50 ohm dummy load for testing until everything's as good as I can make it.

2532. Antenna gain question

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-10-08 14:26:26 UTC
From: Liam Ness <working@the.factory>
Message-ID: <ot68ovo9dgfnecvka693gar6n9q9uqpu1o@4ax.com>
Source record: 31949

I've been homebrewing some simple part 15 transmitters and have always thought that I was safely within part 15 by controling the RF output. I use a spice program to estimate my output levels. I just read a web page that suggests a antenna can increase the RF output power and I wanted advice if that is true. It was suggested that output could be increased from 30milliwatts to 60milliwatts by using this antenna. I understand how you could increase voltage with a decrease in amperage and vice versa, but I was under the assumption that you couldn't increase total power without adding more power. I thought it would violate one of the laws of thermodymanics otherwise. They didn't seem to be talking about more effieciently radiating the transmitters power, but actually increasing it above what is present at the antenna port.

Could someone confirm whether it is posible to increase the power output of an RF transmitter above the total presented to the antenna. If it is, I'd appreciate any pointers to information about this. I don't want put myself out of part 15 by a poor antenna choice. (even though I still can't believe that it is possible, it sounds to much like perpetual motion)

TIA

Of course, it would.

Source record: 31951

Nope -- you can not get out more power than you put in.
Antenna gain is essentially squishing energy into a narrower pattern.
Hence gain over the previous pattern or reference antenna in a given
direction and angle
Gain is referenced to a dipole or isotropic radiator

antenna gain: The ratio of the power required at the input of a loss-free
reference antenna to the power supplied to the input of the given antenna to
produce, in a given direction, the same field strength at the same distance.
Note 1: Antenna gain is usually expressed in dB. Note 2: Unless otherwise
specified, the gain refers to the direction of maximum radiation. The gain
may be considered for a specified polarization. Depending on the choice of
the reference antenna, a distinction is made between:

a.. absolute or isotropic gain (Gi), when the reference antenna is an
isotropic antenna isolated in space;

b.. gain relative to a half-wave dipole (Gd) when the reference antenna is
a half-wave dipole isolated in space and with an equatorial plane that
contains the given direction;
For example: A radio's transmitting power can be concentrated along the
horizon by use of a GAIN antenna. Although you may still be transmitting
with four watts of power, your EFFECTIVE RADIATED POWER (ERP) will be
greatly increased.

2535. Re: Antenna gain question

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-10-08 15:31:37 UTC
From: Joe McElvenney <ximac@btinternet.com>
Message-ID: <VA.000000ae.00406e1b@btinternet.com>
Source record: 31952

Hi,

Firstly, I am not familiar with Part 15 and any comments that follow do not take into account system losses or inefficiencies.

It is generally NOT possible to increase the power output of a transmitter just by changing the antenna connected to it. A transmitter of 'X' watts connected to antenna 'Y' would produce exactly the same radiated power if it were connected to a completely different antenna 'Z' instead. The exception to this is if changing the antenna causes the transmitter to generate more power because of changes in its operating conditions such as in the impedance match presented to it.

However every antenna, other than an isotropic radiator (a hypothetical device that radiates equally in all directions), will have gain in some direction at the expense of that in others. The product of the gain and transmitter power is called the EiRP (equivalent isotropic radiated power) and this is what is generally quoted as the limiting power allowed.

So, if a particular antenna is stated as having a gain of 2 (3dB) over an isotropic radiator then, along the axis of the antenna that has the maximum gain, it will appear that the transmitter power has been increased by 3dB (twice the power output) although the transmitter itself has not in fact produced any more. This 'extra', of course, comes from not radiating power in all the other directions.

Cheers - Joe

Antennas have directional properties.

It the total available power is concentrated in one direction then, as far as the receiver is concerned, the APPARENT power of the transmitter has increased.

But receivers in less-favoured directions from the transmitter will experience an APPARENT reduction in the transmitter's output power.

Liam,

You are absolutely right that the antenna cannot radiate more power
than you feed it. They are probably talking about "effective ratiated
power", which is closely related to antenna gain. You get more power
at the receivers, but only in the directions where radiation is
maximized. For example, a Yagi directs the power more in one
direction, and a "vertical collinear" directs it in a horizontal
plane. Each does so at the "expense" of power radiated in other
directions, but if you don't care about reaching receivers in those
other directions, it's not a problem. But be careful: do the rules
limit the maximum power, or the maximum ERP (effective radiated
power)? (The same thing works for receiving, too. You can use
antenna directivity to increase the received signal level, and to
reject signals or noise coming from directions you don't care about
receiving.)

Cheers,
Tom

John Woodgate is a perfectly respectable figure, albeit with a taste
for bad puns. He seems to be multilingual, with a very good grasp of
the way language works, so his puns do work, even through most of them
don't have the extra symbolic content required to justify posting
them.

If anything, you've just been flattered.

> > I must say that I did wonder about Chiraq/Iraq when I was looking at

Perhaps. I *was* being charitable.

> Again, if you cannot see that the use of the name Chiraq isn't obvious,
> then perhaps your own perceptive skills are challenged by the
> wordplay?

Have you ever heard the two words pronounced?

Chirac is pronounced Sheer-ack ("ack" as in back, lack and tack).

Irak/Iraq is pronounced Ear-ark.

Trying to get a punning relationship between these two words violates phonology, that is, it is defective word play. You made an orthographic attempt to assert a similarity which isn't there in the spoken language, and it simply doesn't work. The symbolic content is there, but the phonetics don't sustain it.

Bill Sloman, Nijmegen

No, Not good news, 30,000 would've been good news.

15,000 is a good start though.

During one of the many wars that the French and the British fought and the French usually lost, the French just happened to capture a British Major. An officer brought the Major to the French general for interrogation. The French general began ridiculing the Major for wearing "that stupid red tunic." The French general said, "Why to you wear that red uniform, it makes it easy for us to shoot you." The British major replied, "If I do get wounded, the blood will not show, and my soldiers will not get scared." The French general said, "That is a very good idea," The Frenchy turned to his orderly and said, "From now on all French officers will wear brown pants."

Almost any kit is worth the time. :-)
These are not bad little rigs, but I would find a kid or two and get them to help you build them. When you are finished, tell them they can have them when they get their ticket.
This might spur a new kid into the hobby.

Just a thought.

You don't mention if a member of the ARRL.. maybe go to their web site and
see if they can retrieve it from their archives and sell you a copy -
especially if not a member.

I MAY have it but not sure. Would have to look.

This IS good - it is what you should expect with the LP filter
removed. (In fact, you may very well "see" these frequencies
even with the LP filter installed.) You're "seeing" the harmonics
with the receiver. It proves the thing is producing oscillation
in the Q1 stage, which is a desired effect. But it doesn't tell
you anything about self oscillation or the "health" of the Q2
circuit. If you disconnect the base of Q2 and the receiver doesn't
hear those frequencies any more, or hears them at a lower level,
that proves that the Q2 stage was amplifying.

What is of interest is the fact that you saw voltage across the
dummy load, after the key was released. That is bad. Q2 should
be cut off by the 33 and 56 ohm resistors with no signal on L2,
and even if it was shorted, there should be no voltage across
the dummy load. That suggests that Q1 must still be producing
a signal, or self oscillation in the Q2 circuit. Check the
capacitor values in the Q1 circuit - make sure it is a 10 uf
electrolytic, and the 220 is 220 pF. The resistance to ground
from the base of Q2 should be about 90 ohms. The components
connected to the base of Q2 should have short leads, and you
want to keep wires and components connecting to the Q2 collector

away from the Q2 base and all of the components to the left
(on the schematic) of Q2.

Yes, IF the present antenna presents a bad impedance match
to the transmitter. Two factors come into play: 1) maximum
power transfer occurs when the source (transmitter) and load
(antenna) impedances match; and 2) the efficiency of the output
stage of the transmitter may be compromised when connected to
a mismatched load, resulting in less RF power produced.

But I doubt whether that was the point. I think that all they
were trying to say was that you would get more effective
radiated power. And the claim of doubling the power raises
suspicion. If memory serves me, part 15 radiations are severely
limited. That may preclude 3db gain antennas.

You've gotten some good advice some others. I'll just add that most Part 15 devices are specified in terms of field strength at some distance from the antenna, depending on frequency, and not in terms of power or ERP. There might be some sections with other criteria, but if there are, field strength specification is by far the most common. The FCC does cut some slack in testing for home-built devices (not marketed, not constructed from a kit, and built in quantities of five or less for personal use), in section 15.23. My copy is nearly ten years old now, so I suggest checking a newer copy of Part 15. It's likely on the Web these days.

Reminds me of a scene from "All in the Family". Archie has been arrested in
a labor dispute. He criticizes one of the other prisoners for being
arrested for drug possession, then takes a hit from a nasal inhaler.

P: Well, what's that then?
A: That's medicine.
P: It's ALL medicine.

I'm sure the photographer for NIST was counting on that attention-getting
weather for the WWVB page's photogenic qualities. :-)

A link on the WWVB page has some typical field strengths given for
various locations in the USA along with a tabulation of daily changes
in that field strength level. There's also a log of outages of WWVB for
those who want to check if they are on when you want them to be.

Almost any Internet search engine will turn up a surprising number of
links to 60 KHz loop antennas built by all sorts of electronic hobbyists.
I did that search a year ago when preparing to build my WWVB loop
receiver and phase-locker for the frequency counter timebase standard.

One of the most innovative in my estimation was the loop built on an
unused bicycle wheel rim (spokes removed). A couple of cuts of a
hacksaw put the gap in the wheel rim to prevent the "shorted turn
effect" from happening. The wheel rim should be a very sturdy former
for winding heavy coil wire around it. A strip of plastic provided
mechanical support for the gap in the wheel. If memory serves, it was
done in San Diego, CA, area and mounted outside under a patio cover.

My own loop is 58 1/2 turns of #14 AWG THHN electrical wire self-
supporting with a mean diameter of 2 feet, 8 inches, then bound with
cheap twine that was well varnished with McCloskey's "Gym-Seal"
floor varnish. The electrostatic shielding was provided by heavy-grade
kitchen aluminum foil (with a gap, of course) that was bound with a
second application of twine, then varnished. Q at resonance is about
44, good enough for about 1.4 KHz BW by itself. With 58 1/2 turns,
inductance is 5.6 to 5.7 milliHenry. Distributed capacity is about 390
pFd, not too bad considering that winding took all but 9 feet of a 500
foot spool (purchased at Home Depot for $14).

The loop is mounted in the attic space above the center room of the house with half of that room as the workshop. That attic space is closed off from the rest of the attic by recent roof remodeling so it has become essentially waterproof now...construction was originally done to work in direct rain, tested only with liberal garden hose sprinkling and measuring of characteristics. The loop connections are balanced above ground with the electrostatic shield at ground potential and two 12 foot RG-59 TV cables are used something like Twinax to a balanced input FET differential amplifier stage below in the workshop. Resonating at 60 KHz is done with a sacrificed dual variable capacitor in the differential FET amplifier. Worked out well and I can't observe any funny spikes from appliances or other non-WWVB signal things after the FET stage. 60 KHz signal voltage across the loop at resonance is estimated at about 90 to 120 microVolts. Location here is northern Los Angeles in the Verdugo Hills (a mile of hills between here and Boulder, CO)..

There are two Oregon Scientific radio clocks in the house, a small one about 4 years old that indicates it has solid automatic updating. Has a small "loopstick" like gizmo inside as the antenna. A large one in the office room, very visible from 12 feet, 1 year old, misses a midnight update about once every two weeks. The small one is "solid copy" all the time. Don't know what the large one uses for a loopstick antenna...wife won't let me open it up to look. :-)

Ferrite/powdered-iron core "antennas" used in consumer market radio clocks seem to work very well. Neither is very directional. The little radio clock was $20 retail and the big one about $25. Battery life is over a year, closer to two years. Both have built-in calendars (leap year is probably derived directly from WWVB data coding).

>experience an APPARENT reduction in the transmitter's output power.

Quite true, Reg.

To get even more basic for new folks to radio theory, assume the
ideal isotropic antenna, one that radiates equally in all directions.
It creates an EM field of the same density of RF energy per square
area all around an ideal sphere enclosing the isotropic antenna.

A half-wave dipole that is very high (elevated above ground) has an
antenna pattern (of RF energy per square area) that is maximum
perpendicular to the axis of the wires. That RF energy is minimum
along the wire axes.

An ideal dipole has a "gain" of about 2.4 db over the ideal isotropic
antenna and such gain is referred to as "2.4 dbi" with the little "i"
indicating the reference to the isotropic.

Because it is difficult to build a reference antenna that can perform
like the ideal isotropic, many more complex antennas reference their
gain to the half-wave dipole and those gains, in db, are labeled as
"dbd" with the little "d" suffix refering to a dipole.

FM and TV broadcast antennas are usually designed for antenna
patterns that are almost omnidirectional in the horizontal plane and
have very little RF energy at elevations above or below horizontal.
The term "ERP" for Effective Radiated Power was first used with
FM and TV broadcasting to indicate the basic power output of the
transmitter multiplied by the antenna gain. For broadcast listeners
they would "hear" a signal as if the station's power output was as
strong as the ERP value.

Directional antennas simply focus the RF energy in certain
directions. What would be an equal value of RF in all directions
with an ideal isotropic antenna now increases above ideal in the
direction of maximum RF energy. That is the "gain."

If one were to plot RF energy density per square whatever in a 3-D graph (almost always the case in antenna analysis programs or on antenna range receiver plotters), the "shape" formed is what everyone intuitively describes as the "pattern." [it could be called an "isopower" plot, I would guess]

For an ideal isotropic antenna, the "pattern" is a sphere. For a good half-wave dipole very high above ground, the pattern looks like a torus or doughnut shape. A typical FM or TV antenna pattern looks like a fat pizza. A very high gain parabolic reflector radar antenna pattern looks sort of like a long breadstick. Complex wire antennas start looking like the outline of the contents of a spaghetti bowl.

It's about 10:30 PM local time here and I'm getting hungry...bye...:-)

The most likely places to find weapons of mass destruction, production programs, and manufacturing facilities are in the United States of America.

Does anybody disagree?

It is much more likely that the Islamists and terrorists would use
WMD when they are made available to them. The US has had WMD
for many years, and only used them recently against an enemy who
had an ongoing practice of testing biological WMD against large
groups of civilian populations.

So, the conditional where 'given access to WMD', who is most likely
to use them now, then the Islamists are VERY HIGH on that list.
Those who have supported the Islamists who might attack the US
will likely be considered to be aiding that enemy in their
quest.

I think all those wires, and the stray L and C they introduce, is the
heart of your problem with getting it to work right.

I'd try building it as close to the way the original article showed as
possible. An inexpensive bread or cake pan can be a good chassis, and
easy to wrok.

7 feet off the ground is less than 1/16 wavelength on 40 meters.
That's just too low.

FOR IMMEDIATE RELEASE:

October 9, 2003
Contact:
George Tranos N2GA
HRU 2004 Chairman / ARRL NYC-LI Section Manager
N2GA@arrl.org
631-286-7562

Oyster Bay, New York - On Sunday, January 18, 2004 at 8AM, the doors of the East Woods School will open for the fifth annual Ham Radio University and the ARRL New York City/Long Island Section Convention. Ham Radio University 2004 is a day of education about Amateur Radio.

The event is being held at the prestigious East Woods School, a private school on 46 acres in Oyster Bay. There will be special forums geared to the non-ham as well as the experienced ham radio operator. The focus will be "hands on" with many demonstrations.

Come join us at the East Woods School, 31 Yellow Cote Road, Oyster Bay, Long Island, and learn about everything from satellite communications, low power operating using radios as small as a tuna tin and the latest in emergency communications. There will also be a VE session for those who would like to take an FCC exam and a Special Event Station set up and operational on HF.

HRU 2004 is sponsored this year by the Long Island Mobile Amateur Radio Club and is a cooperative effort between over twenty clubs and organizations in the New York City- Long Island area. Besides the forums, there will be tables set up with information about different organizations and clubs including the Red Cross, Salvation Army, National Weather Service, Friends of Long Island Wireless as well as ham radio classes, local FCC exam schedules, public service and other activities. New this year is a special seminar presented by the ARRL explaining the different on-line educational courses that are now

available.
They include Emergency Communications, Antenna Modeling, HF Digital
Communications, Beyond Repeaters, RFI and more. These are part of the ARRL
Certification and Continuing Education program (http://www.arrl.org/cce).

Join us for a day of fun and education for the whole family! Admission is
open to all - donation is $2 per person. (refreshments will be available)

Directions: (The school is approximately 18 miles east of the Queens/Nassau
border in Nassau County) Take the Long Island Expressway east to Exit 41
North
(Rte 106/107). 106 and 107 will split about 1/2 mile north of the LIE,
follow 106 north (to
the right).

Bill Sloman wrote:
Go about 4 miles to Route 25A. Make a right and head east on 25A and go
about
2 miles to Yellow Cote Road (on your left).

Look for the white sign which says "East Woods School". Proceed
approximately
1/2 mile - the entrance to the school will be on your left at another white
sign. There is parking available in one of the three designated areas in on
three sides of the school. Look for the HRU signs!

Indeed. I saw one of those here: http://lakeweb.com/rf/wwvb/ (may or may not be the same one you found), and it is a clever idea. I'm thinking now I might build one like that as well as a ferrite rod version to compare with; since the ferrite will increase the effective area of the antenna by the square of its effective relative permeability, I want to believe that a 1/2" ferrite rod can compete with... well... at least an air core loop, uh... the size of your hand? (I don't have various references here with me to start looking up the effective relative permeability of a ferrite rod of a given l/d ratio... hopefully in the ballpark of 20-50...)

I also found that people did occasionally ask about really large diameter (>1") ferrite cores, and while the usual response was that you could, of course, pack a bunch of smaller rods together to make a big one, apparently no one has the considerable $$$ around to build, say, a coffee can sized ferrite core antenna. Would be something to see though! Anyone want to donate some fat ferrite rods to me? :-)

That's good to hear; noise seems to be a common concern.

I believe you said your receiver was a synchronous design, correct? I'm still liking the envelope detector approach, but I've yet to hear about anyone successfully employing this (simpler) method.

> 60 KHz signal voltage
> across the loop at resonance is estimated at about 90 to 120
> microVolts.

I don't suppose you have an estimate of your signal to noise ratio?

> Location here is northern Los Angeles in the Verdugo
> Hills (a mile of hills between here and Boulder, CO)..

I'm in Corvallis, Oregon, which -- eyeballing it on a map -- is perhaps half again as far from Boulder. I have one of the inexpensive self-setting clocks that does work pretty reliably _if keep in certain positions within my house_. I've read that these also set themselves at night when the SNR is significantly higher too.

> Ferrite/powdered-iron core "antennas" used in consumer market
> radio clocks seem to work very well.

I was going to get some of the 1/2"x4" or 7" rods from Ocean State Electronics here: http://www.oselectronics.com/ose_p88.htm ... they also have some inexpensive pre-wound rods meant for AM radios (http://www.oselectronics.com/ose_p91.htm), but they're apparently tuned for the AM broadcast band and therefore I'd have to re-wind the things anyway.

This is hopefully going to end up as a class project and therefore the goal of learning how to build your own antenna and receiver is the reason I'm not intending to just go and use someone's "all in one" WWVB receiver IC (even though colleges seem to push that approach these days... but then _someone_ had to design that IC, right!?).

Bush invested another 600+E6 in finding WMD's, aren't there other things
more important?

This is from a group of volunteers, trying to do their best, living on
donations:

quote:

In November a team of **** will travel to Baghdad to establish the center.
We are renting at least one large house that will be fitted with many beds
and all the supplies needed to serve the children for one year. Then we
will welcome the children to a safe place where they can rest and heal. It
will be impossible for us to help all the homeless children in Iraq, but
with your help we will be able to reach out to many of them.

end quote

They are trying to help a few of the thousands of homeless children whose
parents were killed in the war, and they have to do that by donations,
while bush just throws another 600 miljon down the drain.

anyway, you can mail me if you want the url to make donations to these
volunteers.

Why, you're absolute correct, Reg! After all, you wouldn't want us to have to start all over from scratch again, like in 1940 or so, to build up the wherewithal to save your butt would ya?? After all, if Hitler hadn't been such a loon he'd have ate your lunch long before we Yanks could have done a thing to stop it. And today, you *really* want to just let today's versions of Hitler, of which have been clearly demonstrated to be even more numerous, have a free shot at you? How 'bout the Russian bear we kept away from your door for half a century?

You don't appreciate it? Why am I not surprised?

>Roy Lewallen, W7EL
>

Yea, thanks Roy, you are right. I know that Part 15 limits are field
strength based, and there isn't a direct corrolation with output
power. I have been relying in the 15.23 home built portion, which
provides some lee way to tinkerers. 15.23 acknowledges that home
builders probably don't have test equipment, and instead it is
directed at design. My stuff is super low power, at least that is
what my spice program tells me, so I'm not really worried. If I do
screw up, and an FCC representive contacts me (the first highly
likely, the second much less so) I'll push section 15.23's
applicability, stop using the transmitter and redesign per section
15.5.

Even though I'm in a really rural, really mountainous location, I
spent a good amount of time going over part 15 so I could justify that
anything I do is done in a good faith effort to be in compliance. You
are also right that part 15 is now web based. They just released a
new version of the regulations in August and you can d/l it as a PDF
from the FCC website.

I guess this all (well most anyway) makes sense. And while at first I
was glad that you all confirmed my thinking that you can't get more
out than you put in (although you can get what you put in out more
efficiently), Roy's part 15 comments are making rethink things.
Because I'm field strenght limited, I concievable could be over limit
in one direction. I don't think that I could accidentally rig an
antenna like in Reg's example, but just for piece of mind could you
give me an idea of how far from isotropic (or how close to
ultradirectional) a vertical piece of wire would be at 1/4, 1/2 and
not even close to being matched to wavelength? I'm not looking for
calculations or anything, a simple very, not very or somewhere in
between to isotropic would be fine.

TIA

Thanks for reading this.

I need a Windows-compatable program or TSR
(can be DOS, as long as it will run on a Windows machine)
that will give me an open audio channel, sound card to sound card,
from one internet-connected computer to another.
Needs to have good bandwidth for broadband connections,
scalable down to narrower bandwidth for dial-up.
Need to pass at least 15-20 KCs of bandwidth for broadband,
4-6 KCs for dial-up.
Don't need any bells or whistles. Does need to maintain the
channel once opened. I can rig some kind of hardware "transmit,"
but that would complicate the application.
Can anyone help?
Thanks again and 73,
Dave AB5S

Sounds good. I've not experimented with ferrite or powdered-iron
core antennas for my project. My loop was based more on the fact
that there was attic space above the interior workshop and the trap
door diagonal dimension set the maximum loop diameter to 2' 10".
#14 electrical wire was actually cheaper than purchaseable coil
wire for 500 feet and was a relatively calculable-before-build thing.
I could have put in a 5 foot diameter loop but would have to dismantle
a few things to get it there or spend time bent over while constructing
it. :-) [winding and wrapping took a LOT longer than expected!]

My project is specifically for deriving the 60 KHz carrier, as clean as possible prior to mixing-dividing etc. to compare the frequency counter timebase frequency of 10 MHz. With two commercial radio clocks on hand, WWV over the Icom R-70 for time hacks, wasn't any desire to decode the time signal.

To get a narrow receiving bandwidth "raw," the tuned loop handles the initial selectivity. A differential FET with tuned transformer output both gets rid of some common-mode RF pickup and the transformer Q of just about 30 drops the far-frequency attenuation more (bandwidth of the transformer is roughly 2 KHz, wider than loop alone). From there on things are quite different.

The amplified, "wide" bandwidth WWVB signal is fed to an old MC1350P video-RF differential amplifier with a local oscillator at about 246 KHz into
the AGC voltage pin. That makes it an active balanced mixer. The output of that goes to a single quartz crystal filter at 186 KHz...an old surplus xtal acquired decades ago, presumably from a timebase or marker crystal for a military radar set of ancient vintage. A second MC1350P mixerf, fed with the same 246 KHz LO but the output tuned to 60 KHz downconverts to the original frequency.

The two mixers need to have the LO injection with at least 30 db of isolation between the two...takes some playing around and I got about 40 db. The up-conversion and down-conversion was to use a crystal filter at a frequency different than 60 KHz (avoids re-radiation pickup in the loop for one thing or other stuff in the breadboard stage). The crystal filter is still being played with but the basic circuit is just series-resonance at a single frequency, looking for the narrowest bandwidth possible. Getting about 5 Hz of -3 db bandwidth right now and am having to fuss with temperature stability of the L-C tuned LO. Gets a bit fussy to test out that narrow a bandwidth...:-)

Note: The heterodyning (mixing) process doesn't change the relative phase of a frequency-changed signal. A second heterodyne back to the original frequency retains the original relative phase. The trick there is to get isolation from one LO injection port to the other. That avoids any feed-through which can spoil the crystal filtering action. I use a couple more MC1350s to split out from the L-C transistor oscillator with supply pins separately decoupled and gains set low by using very low collector load resistors.

I might be satisfied with a 10 Hz bandwidth overall if the fussing-around period eats up too much time. Right now it looks like a very clean RF carrier waveform with annoying 1 second bounce up and down when viewed on a scope. I'm planning on adding a limiter stage or two following which will remove the modulation almost fully (!). The MC1350P (an old Motorola part based on their metal can MC1590) makes an excellent limiter when over-driven.

>> 60 KHz signal voltage
>> across the loop at resonance is estimated at about 90 to 120
>> microVolts.
>
>I don't suppose you have an estimate of your signal to noise ratio?

No. I'm looking for the carrier as clean as I can get it. There's zilch front-end noise. There are some occaisional "bumps" from impulse stuff from somewhere but nothing from horizontal TV sweep 4th harmonic at ~63 KHz. Closest TV set is about 15 feet away diagonal.

Offhand, I'd say the S:N ratio is consistent with a 10 Hz bandwidth at -3 db points. That would be fine if I were demodulating the WWVB time code changing at a 1 Hz rate.

>> Location here is northern Los Angeles in the Verdugo

Their automatic sensing varies with the manufacturer. NIST has some info (in a FAQ page?) on their site. The little Oregon Scientific unit here (older one) checks itself every 8 hours, the larger new one (by same company) checks itself in the hour after midnight.

>the AM broadcast band and therefore I'd have to re-wind the things anyway.

Couple of things there. Core permeability may be different at 60 KHz versus the 550 KHz low frequency of AM BC band. If it is okay then you can get away without rewinding the coil on it, just retune it with more capacitance if your input circuit can stand the lower impedance.

At 60 KHz you can use a wide-range audio test oscillator for checking resonance Q, measuring inductance, etc. I was using an ancient Heathkit audio oscillator (Wien bridge type) with the 5-digit frequency

counter built into a French-made DVM newly purchased from Mouser.

>This is hopefully going to end up as a class project and therefore the goal
>of learning how to build your own antenna and receiver is the reason I'm not
>intending to just go and use someone's "all in one" WWVB receiver IC (even
>though colleges seem to push that approach these days... but then _someone_
>had to design that IC, right!?).

Hans Summers has a nice section on his website in the UK that has
full particulars of his 1991 first-year university project of a 60 KHz
receiver-decoder for the Rugby station there. He used discrete TTL
packages for the entire decoder! [Rugby modulation code a bit
different compared to WWVB]

http://www.hanssummers.com/electronics/clocks/radio/radioclk.htm

Hans (who appears in here from time to time) has _everything_ on
that project available there. Interesting!

If I type the link incorrect, just get www.hanssummers.com and
navigate from there. Interesting website with lots of different projects
well-described.

If I were going for a radio clock project, I'd get a reasonably-clean
signal at 60 KHz by analog means with a bandwidth of 10 to 50 Hz
on the output then use one of the many PIC microcontrollers to do
the decoding...and also readout control. Microcircuits has free
development software for download that works in any PC. Decoding
algorithms will be roughly the same whether done in software or
hardware and (in my estimation) your own software development can
be as much fun as handling lots of hardware. Your mileage may vary.

Have fun. Things are a bit different working with a very fixed frequency
station at LF with very slow modulation rates! :-)

From: Jim Pennell <NoSpam@killspam.com>
Message-ID: <jFIhb.6578$dn6.2675@newsread4.news.pas.earthlink.net>
Source record: 31899

I read an article about WWVB reception for a frequency standard that made use of a zero crossing detector to detect the 60 KHz signal.

His point was that many detection schemes can get a false count now and then due to the 10 dB drop in signal strength that WWVB uses to encode the time information.

Apparently, the zero crossings are quite stable regardless of the amplitude change.

For a system to recover the time information, I'd be inclined to simply amplify the incoming and then use a diode detector of some sort. Well, that and a SLOW AGC system...

I do not think it would need anything as complex as a synchronous detector since any changes in the propogation of 60 KHz is very slow. Admitted, the occasional noise burst may result in a false pulse now and then.

Since you are likely to feed the signal into a computer of some sort to decode the pulses to a time signal, you can add some programming to handle the occasional false pulse.

Jim Pennell

Thanks for that most informative response, Avery, and also the link to Hans' project.

Hopefully next week I'll get around to constructing my antenna (need to visit a bike store and ask for busted rims this weekend... :-)). From the signal strengths you were quoting (<100uV), it seems as though it's iffy whether or not you'd see anything at all taking the output of the antenna (with resonating capacitor) and feeding it directly to a spectrum analyzer (since we're looking at, oh, -70 to -80dBm into 50 ohms, which is starting to push the noise floor of at least one spectrum analyzer I have available to use). If there's nothing visible at that point, however, hopefully after a differential FET amplifier as you suggested the signal will be visible. (I find it very reassuring to be able to see you actually have some signal present at each point of a porject's development...)

Hi all;

I plan to build an HF power amplifier, output about 80-100W, not critical. It might look like as those used in popular Yaesu, Kenwood or Icom end PA stages, i.e. first stage as driver and the second as final amp., both in push-pull, transformer-separated. It should run directly with 13.8V supply. Of course, everything based on popular transistors as MRFxxx, 2SCxxxx, 2SDxxxx, IRFxxx MOS or russian (would be the best, since there are no problems with buying ones in my country). I've spend several evenings searching in googles, but I've failed to find anything suitable for me. Either I'm such a demanding person, or missed something while looking up in endless vastness of the internet. If anyone knew a well-designed project, or built one whenever in past, it would be welcome.

TIA

You are forgetting a small thing called WW-II? America was at war
with Japan when they dropped the bombs on Hiroshima and Nagasaki. At the
time it was seen as the only way to end a world war that was pulling
down most of the world economy, killing millions of people and using
resources needed for people to live a normal life all over the world.

While I hate to see a life taken, sometimes you have to shoot a rabid
dog to keep people safe. It take bigger bullets to stop Bigger dogs. If
you consider this "used WMD in anger", I feel sorry for you.

Like every other country, Japan had their military and civilians
mixed. No country draws a pair lines in the sand and segregates their
military and civilians on separate sides of their country, with a no
mans land between them. You need to study history, military strategy,
and think about the way society works.

Why not just copy a suitable proprietory schematic? What's the problem
with that?

Have you looked at Motorola's website?. There are a good number of
Application Notes there with amps from 10w to Kw's for HF to uWave
described in detail. There is also a company in US that stocks the
'hard to find' bits, and Kits, for them. Sadly I can't find the URL at
the moment.

I don't have any copies of CQ but do have all the QST CDs and there ain't an article in there about the Micronaut transmitter. There was however one on a companion receiver which may be the reason you have had confusing referrals to it. The transmitter was sold as a kit which may account for why the circuit is not quite in the public domain.

It would appear that back in '97 K4WTJ published some articles on it in CQ, so will you need to find someone with those particular back issues. I did a google search on Micronaut but couldn't come up with the original circuit. I got the impression though that it is similar to one of the 'TUNA TIN' designs which have appeared in QST from time to time and, with those circuits, I can help you.

Hang in there - Joe

Yes, that's a good idea, however it is not always possible to decipher values of the elements, number of turns, type of magnetic material and so on. You cannot determine board layout, either. I believe it is relevant to the circuit not to start oscillating.

>Hopefully next week I'll get around to constructing my antenna (need to
>visit a bike store and ask for busted rims this weekend... :-)).

The circularity shape of the loop has little relation to its ability to
intercept the magnetic field of the signal. There's a slight variation
from perfect circle to octagonal to square shape. Sensitivity is
related to the loop's total area and, most especially, to the number
of turns of wire in the loop.

>From the
>signal strengths you were quoting (<100uV), it seems as though it's iffy
>whether or not you'd see anything at all taking the output of the antenna

>a differential FET amplifier as you suggested the signal will be visible.
>(I find it very reassuring to be able to see you actually have some signal
>present at each point of a porject's development...)

I don't "see" anything directly at my loop in the way of signal from
WWVB. A resonated, relatively high impedance loop (mine is about
93 KOhms at 60 KHz) will lose everything in the way of sensitivity
if loaded down with 50 Ohms input Z of any other device. The purpose
of the differential FET input amplifier is manyfold: Present a
differential,
balanced short feed to reduce common-mode pickup; provide a
coupling from a high-impedance source (resonated inductor of
moderate Q) to the lower impedance of later amplifiying circuitry; to
enable tuning for resonance remotely when the loop is 8 feet over-
head and inaccessible.

"Signal strength" was calculated based on measured gains of the
input stage, loop impedance simulated by a series resistor, all done
at higher voltage levels. The loop voltage and field strength would
then be equal to the differential amplifer output voltage divided by its
voltage gain. One CAN see amplified signals of a milliVolt with most
higher-end oscilloscopes...even if the WWVB has a slow, dull, not-
directly-interesting RF envelope. :-)

The number of amplifying stages following a moderate-gain input stage is really a sort of arbitrary thing, depending more on what one DOES with the output. Since WWVB is going to about as fixed-tuned and stable on 60 KHz as anything can be, there should be no problem with fixed tuning of those following stages. Even if the Q of those tuned circuits are low (15 to 25, maybe), they have an advantage of providing even more skirt attenuation on either side of 60 KHz. The 4th harmonic of NTSC horizontal sweep is 3 KHz higher than 60 KHz...some TV receivers spritz out a lot of that while others have minimal output. Attenuation at around 63 KHz is probably desireable for household locations in North America.

I'm going to eventually use some moderately-high input Z comparators after extreme narrowband filtering, that to square it up for CMOS TTL digital levels. That isn't a necessary, just a convenience for me. If the amplified signal level can get above about a half Volt p-p, then an ordinary digital Schmitt trigger gate or inverter will act just fine to square up the signal, make it compatible with other digital packages. Did that before for other applications and no problem.

Squaring-up the received signal doesn't offer much for improving the signal to noise ratio. That may make it LOOK like it is "noise free" but that is only because the existing noise is transferred from the vertical direction of a scope picture to the horizontal. It's harder to observe the horizontal display noise due to the very fast transition of a comparator or trigger output. Squaring up is absolutely necessary to couple the signal to any kind of digital circuit for time decoding.

>out.

Fairchild's application note AN-393 is an informative one from the
standpoint of _transient_ switching analysis. Analysis or simulation
for impedance matching, presuming matching at a single frequency,
leans towards _steady_state_ analysis.

"Impedance matching" of very fast transition time rectangular
waveforms must be done over a very wide bandwidth to insure
fidelity of the rectangular waveform at the far end of the transmission
line. Digital devices are characterized under near-total On or Off
current source drivers...working into very non-linear active device
loads.

To get into the theory of a narrowband source impedance condition
is possible. Some of that has already been done with the "Class E"
amplifiers using certain SCR devices at 40 meters, such as several
examples at Cal Tech, Pasadena, CA, groups. A search on Class E
material might turn up something that would fit your application.

Class C tube or transistor operation can be considered a sort of "soft
switching" condition similar to On-Off current sources but that is
complicated by the fact that the On state of the active device varies in
current carrying capability depending on a narrowband load... hence the
"soft switching" label. Triode to pentode vacuum tubes were never very
good switches in On-Off operation compared to transistors.over the
very wide bandwidths necessary for fast-transient digital waveforms.

While it might be an interesting intellectual exercise in analysis, it will
take considerable time. Far more time than geting up a small
breadboard test circuit and TRYING IT OUT. Nearly all of the "74" (or
"54") family components are relatively cheap...small-scale integrated
circuit packages cost less than a dollar each in single quantities.

Depends on the news browsing software you have, but generally when you
look at a message, it is marked as "read". Depending on the options
set in your software, you can choose to see all available messages, or
just the unread ones. If the latter, every time you refresh or purge
the group, you will no longer see the already read messages.

Happy trails,

Your ok so long as the ampliflier and squarer upper dooper doesn't leakyage back into the loopy thing or previous ampliflying bits.

> standpoint of _transient_ switching analysis. Analysis or simulation
> for impedance matching, presuming matching at a single frequency,
> leans towards _steady state_ analysis.

You are right about AN-393, and the non-linearities, of course. However when I first posted I needed a ballpark figure and the app-note gave it me. My application is a rather mundane, fixed frequency, 10MHz frequency standard required to drive a counter/signal generator combo and whose output should be reasonably sinusoidal so as not to spray harmonics around the place. The buffered or inverted output coming off the VCXO has to supply about 1V pk-pk into 50 ohms. A 74HC04 or '07 followed by a single-section, image-parameter, pi -section filter appears to do the job but it was just my day for being scientific :-(

Cheers - Joe

Never use a crescent wrench as anything other than a wrench (unless it belongs to someone else). Find an open-end wrench and tap that with a hammer instead.

"Ham" doesn't need to mean "Hack".

All the best,
KZ1O

Make sure to keep the capacitor leads in the filter very short, and build the filter so there isn't a sneak path around it. HF filters often lose their lowpass characteristics at VHF and above due to stray impedances and resonances. The 74HC series switches very fast, so it generates some really high frequency stuff you really need to effectively filter.

Thanks Len. I always read in here but rarely find the time to post anything
much.

My 60KHz receiver was just a Tuned Radio Frequency (TRF) design and very
poor, indicating the state of my knowledge of receiver architectures at the
time. If I were doing something similar today I'd do it very differently.
I'd probably use a crystal oscillator divided down to something near 60KHz
and heterodyne that down to audio frequencies for further filtering to get
the 1 pulse per second, with coded length. I'd probably still make the
decoder in TTL though ;-)

The MSF Rugby transmissions are a 60KHz carrier interrupted each second for
either 100mS representing binary 0, or 200mS representing binary 1. Details
at http://www.npl.co.uk/time/msf.html.

Rugby is a town as near to what one might consider to be the centre of
England as could be judged. By coincidence I happened to drive past the
antenna farm on Saturday on my way up the motorway. I'd previously seen the

antennas from a great distance but up close: very impressive. There are 12 huge masts. I think there are 12, but you don't want to spend too much time looking at the antennas and not the road, or you'll join the wrecks of all the other unfortunate radio amateurs strewn along the motorway embankment. Who no doubt departed this mortal coil happily dreaming of how many wavelengths above ground they could put their HF antennas ;-) As you get closer, a whole forest of smaller masts becomes visible.

There's a picture here
http://www.subbrit.org.uk/sb-sites/sites/r/rugby_radio/index.shtml.
Actually, reading that now shows there are indeed 12 masts, 820ft high each one, so my count was correct. I read somewhere else that there is a plan to close the Rugby site, a pity.

Hi,

Let's say I'm trouble-shooting a circuit board with several stages of
RF amplification in addition to a primary source in the form of a
VCXO. I'd like to be able to bypass certain parts of the signal path
by the use of a jumper wire. This wire may need to be up to 4 inches
in length to have sufficient reach between stages. Can anyone see a
problem with this? I mean, rather than a single wire, should I use
some sort of grounded outer lead like coax to carry the signal?

Hi

Is there any possibility to change the sample frequency on the soundcards ?

If you take the MMSSTV program from Mako mori, he has done the software so you can set the sampling frq to eg. 11.030 instead of the 11.025 but if I am using the PC-ALE software from Charles G4GUO I dont have this possibility. Especially laptop computers soundcards dosnt follow the standard, which means that most of them are more or less useles in connection with software that hasnt the possibility to adjust the sampling.
If I look in the Codex settings, I can choose between the standard values 8000Hz, 11.025 etc. but none gives me the possibility to setup a user sampling frequency.
Is there a way to change the soundcards sampling frequency and how ?

Thanks in advance

The main problem with it is that the two stages being connected with the wire will no longer see the same impedances they see when operating. This can cause a multitude of changes in their operation, including modifying their frequency responses and gains. It can also cause instability that's not present when the intermediate stage is in place. The amount of the changes depends greatly on the nature of the cicuits being connected, as well as the frequency. The changes will almost certainly be severe at UHF and considerable at VHF. At HF, you might get by with it and you might not, depending on the circuits.

It's good practice to design each stage for a standard input and output impedance, with 50 ohms being overwhelmingly the most common choice for RF circuitry. That is, each stage should be designed for correct operation when driven from a 50 ohm source and terminated with a 50 ohm load. The great benefit to this approach is that it allows independent testing and characterization of each stage with a standard set of test equipment. A secondary benefit is that any stage can be replaced with a jumper of 50 ohm coax without changing the impedances seen by the connected stages.

often, u might find a need for a diplexer at the output of the 74HC
series! quite like terminating the HEXFET power amps. I would suggest
that u include a 22 ohms resistor in series with the output and about
20-30 of capacitor to smoothen out the jitter on the square wave
edges. we used to need this to prevent the memory IC from blowing up
when driven by fast TTL chips with a large fan out.

Don't hack up the board just to troubleshoot...(if it is a pcb)
make a rf sniffer instead. one method I use is a piece of coax
connected to a spectrum analyzer with a dc block connector.
the other end of the coax is stripped to expose the center conducter
as a probe tip.
course if this is a hobby project you probably don't have a spectrum
analyzer...if that's the case...my heart bleeds...

Paul, offhand I'd say no problem since I've done that on the bench
many a time from LF on up to low UHF. The waveform may not
be optimum but "quick check" circuit jumpering should not be a
source of worry. Not at 4" length.

I'll have to add that my personal experience is based on circuit
boards (including breadboards of the universal kind) all had fairly
good ground planes ("earthed" planes, heh heh).

Digital circuits have rather high frequency content, must have to
carry very fast edge-transient-time signals. I've done a lot of
one-shot applications that were not-yet-formalized production
designs using 4 1/2" square Douglas Electronic circuit cards*
using #26 insulated wires snaking around the card containing up
to 16 DIPs. Fast revisions of wiring and package connections were
done without any problems.

* Douglas Electronics has excellent quality prototype cards but
they are also quite expensive, I'd say too costly for amateur home-
brewing at $15+ or so now.

No problem here. :-)

As a first approximation for the application, it should be intuitive that
the peak-to-peak voltage out of the gate/inverter into a resistive load
would yield the beginning of data on RF power output capability. The
rest can be figured out on the bench.

More eleborate data sheets for particular devices have specs for
driving different loads, usually as the logic 1 level voltage minimum
for a given resistive load. Depends on the manufacture's budget for
data sheet preparation, I would guess, since those vary in content.

If others are trying such an application at maximum power handling
capability and need lowpass filtering, a caution. Some elliptic filter
input impedances can vary widely in stopband frequencies. That
might, but not necessarily, result in edge spikes above breakdown
at the gate/inverter output. Butterworth response filters are the
most forgiving of such but also have the lowest stopband attenuation.
The 74HC family ought to be rather robust on that and I don't think
it is a great concern.

I did encounter some problems with 74S devices driving filters some
years ago when using a gate as a digital mixer for an optical
interferometer phase measurement instrument. That was with old
74S family devices before the newer incorporated protection
devices were introduced a decade or so ago.

"Digital mixers" work very well indeed when both RF inputs are at
similar high levels common to digital circuits. It's quite easy to get
difference frequency output and to lowpass filter it to remove the
input frequency components. Never tried it for sum-output mixing,
probably need a spectrum analyzer handy for such circuits.

Communications Concepts continues to advertise in printed media.
They still have advertisements in RF Design, an electronics trade
publication.

Haven't looked at Communications Concepts web site lately but a
couple years ago their reproduced Motorola application notes,
most authored by Motorola's Helge Granberg, were of less than
best quality in PDF. Still readable, though.

2633. A New Concept: Virtual Spectrum

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-10-14 01:27:32 UTC
From: David Stinson <arc5@ix.netcom.com>
Message-ID: <3F8B4D6D.31D19695@ix.netcom.com>
Source record: 31800
Cross-posted to: rec.radio.amateur.homebrew,rec.antiques.radio+phono,rec.radio.amateur.policy,rec.radio.shortwave,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc

Thanks for reading this.
I have today submitted an article to QST magazine entitled
"Virtual Spectrum: Beating BPL at its own game,"
detailing a concept that can greatly impact our radio hobby.
I wanted to "put down a marker" to date the introduction
of a new ham-radio innovation, and to officially place
the idea in the public domain, so the maximum amount of
"tinkering" with it can happen.

This concept uses the bandwidth available on the Internet
and some simple circuitry to create a replica of a segment of
the radio spectrum, stream it live or prerecorded to another
internet-connected computer and reconstruct that radio spectrum
at your location. *Any* radio equipment you wish to use
(given an Internet connection with sufficent bandwidth)-
from modern PSK-31 rigs, SSB nets, WW-II modulated oscillators
all the way back to ancient spark transmitters
with crystal receivers; all can legally communicate just as though
you were on-the-air. The system is bi-directional, allowing
QSOs between stations that normally could not communicate.
If you can't hear weak signals because of noise in your area,
the concept allows you to build a "remote front end" and
transport the radio spectrum in a quiet area right to your rig,
bypassing the problems in your location.

I believe this concept can be the answer to BPL, "noise holes,"
antenna restrictions, HF "jammers" and many other obstacles to
using our radios. There is great potential for many uses,
and a possible niche market for someone with the resources
to develop the equipment.
I have already built prototype equipment to prove the concept
and it works splendidly. The article includes construction
details. The circuits are simple and you can get
95% of the parts at Radio Shack.
By the time QST publishes (assume they accept the work),
we should have completed the first Virtual Spectrum QSO:
two World War 2 BC-611 handie-talkies (output: about 60 milliwatts)
will communicate over a path of about 2000 miles.

If QST does not publish the concept,
I will publish it myself on the web
immediatly after hearing from them.
I am indebted to Mike Hanz, aafradio@cox.net

for invaluable suggestions and encouragement.

This coming Sunday....

+++ Now even more Buyers Parking !!!
Thanks to TKT we have use of their new parking lot
across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday October 19th 2003
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

I didn't buy my radios and build my stations so I could
let them gather dust while I "chat" on the internet.
I want *use* them.

I recall back in the early 70s how excited I was about the future of ham radio via satellite and how I expected to see a flood of activity (that never materilaized) to take us through the bad sunspot years.
Dave, maybe hooking up all those BAs thru transverters will be a better answer.

"Wireless" doesn't always work, if you're in a "noise hole,"
or if the mode or radio you want to use isn't "legit" anymore.
So that's one use, yes.
The idea is to use our own radios as source and sink,
bypassing the vagaries of Mother Nature's propagation
and local noise sources. Or, if you're in a "noise hole,"
to bring spectrum to you from a "quiet" location.
It also allows the use of heretofore prohibitied modes.
For instance:
In the article I detail how an old longwave maritime
rig on 415 KC A2 can carry on a real-time CW QSO with
someone using a modern rig on 40 meters.
It will be a real boon for the "boatanchor" community.
I do hope QST will consider it.

Right!

I was excited about the microsats. Then they built this monster satellite
and spent millions on it. I don't know anyone in a 100 miles who uses it.

Just what would this internet communicating have to do with Ham Radio ?

Again, why would you need the ham equipment , considering you can do all the communicating to begin with just by being on the internet?

Not to be personally offensive (I mean it), but this sounds rather silly to me.

Ham Radio is communication over the airwaves using ham gear. Websurfing is connecting to other pc's and servers etc using the telephone line or cable, and the internet.

They both are FUN but they ain't the SAME !!

Dave, have fun. I'll check back to see how it went when I get back from the lake from fishing with my grandsons. And I'll be puttng my gear up for sale. If it doesn't sell, I'll take it fishing next time along with a good rope to tether the boat.

2644. Direct conversion spectrum analyser

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-10-14 05:58:24 UTC
From: farhan@hotfoon.com
Message-ID: <8331b126.0310132158.4a53459c@posting.google.com>
Source record: 31811

here is a spectrum analyser design that i would like the group to comment upon.
1) we take the input via a low pass filter, up convert it to an IF of 100Mhz or so, and follow it up with a direct conversion receiver at 100 Mhz with 20 khz bandwidth.
2) the upconverting local oscillator is a VCO that is controlled by a sweep generator. the sweep is controlled by a PWM modulated signal in the audio range.
3) the sweep generator input is connected to the output of a PC sound card. the output of the direct conversion receiver is connected to the input of the PC sound card.

Now, by clever programming of the sound card on the PC, we can make the VCO sweep our passband of interest. The sound is often digitsed at 16 bit levels (in the better systems at 32-bit level). This will effectively give us 90db range. the lograithmic scale can be implemented in software. DSP can be used to set the bandwidth to any particular size.

the most important benefit of this design will be that even hams without expensive oscilloscopes will be able to easily make a PC based analyser that is easy to assemble and use.

if there isn't any glaring problem with this design, i would like to pull out my soldering iron and take a go. is anyone here with spectrum analyser experience willing to share knowledge?

How about using an open collector device like the '06 or '07 and put a parallel resonant circuit from the output to V+ (which might be Vcc or some lower or higher voltage depending on your need and buffer voltage rating) and analyze this as a class C amplifier stage ?

If you have multiple OC inverters, run two out of phase into a centre tapped transformer (CT to V+) and put the resonant circuit on the secondary. Again, V+ could be adjusted to give required impedance and power levels. This circuit would have good symmetry, since the impedance would be the same on both half cycles, thus reducing the even harmonics, thus, the third harmonics would be the first one to worry about, if you need sinusoid output.

I have recently completed a spectrum analyser, see
http://www.hanssummers.com/electronics/equipment/spectrumanalyser/index.htm.
It is
awaiting possible magasine publication so there are not yet any circuit or
construction details on the page above. If you want the full details, email
me privately and I'll show them to you.

I also tried a direct conversion receiver initially. It doesn't work on in
analogue (i.e. non-PC) analyser, because there are all sorts of heterodynes
of the sweep frequency against the directly converted incoming signal. Of
course I kicked myself afterwards for not thinking of it in advance to save
myself the time of the experiment.

I think broadly speaking the final IF should be substantially higher than
the frequency of the sweep waveform, so that the final filtering works
faster than the sweep. There are lots of people in this forum far more

advanced than me who will probably be able to explain it better in terms of filter response times or group delays or something.

Though there might be a way of untangling everything in software so it may work. Being direct conversion you'll also have both sidebands present, which will create further complications. Again, clever software might untangle it but I think it's far from straightforward.

Another problem is the narrow bandwidth. 20KHz is a nice bandwidth to have but I think in a spectrum analyser you also want wider bandwidths available. In particular, if you are digitally generating your sweep voltage, and trying to cover the whole 100MHz, you need of the order of 100,000 / 20 = 5,000 discrete measurement intervals. You can't display that many horizontal pixels on screen. You could average them in software, but at the low 20KHz bandwidth, you're going to need quite a slow sweep rate. 5,000 measurements are a lot and will take a long time.

It's a nice idea but I don't think it will work as it stands.

My recommendation would be to add a 2nd IF to your design, 2nd IF amp and logarithmic detector. In my design I used a 145MHz 1st IF, so the VCO sweeps 145 - 290MHz. The 2nd local oscillator is at 153MHz for an 8MHz 2nd IF, amplified then passed into an AD8307 logarithmic amplifier. Anything similar would work well. I used an SA602 front end for simplicity, but a diode ring mixer would give potentially better performance than the 65-70dB dynamic range I achieved.

You can still use the PC for a nice display, rather than an oscilloscope. Just feed the log output into your PC sound card, and have the PC sound card control the sweep as you suggest. I think you'll solve a lot of problems by adding these few extra modules to the analogue front end before introducing the PC. Incidentally, this is exactly what I'm doing with my Mk2 analyser, see
http://www.hanssummers.com/electronics/equipment/spectrumanalyser2/index.htm.

Now I'm hoping for someone to put it all more clearly and professionally than I have here ;-)

Dave, this is a fantastic idea. It opens up great possibilities for international co-operation between radio hams. When your spectrum in the USA is wiped out by BPL, we hams in the UK could lend you some of ours. I'm sure the ARRL and RSGB could negotiate an agreement, and sort out the reciprocal licensing issues.

Also, by the use of spectrum transformation, which you touched on in your follow-up posting, it would allow hams with restricted licences to experience propagation on bands on which they are not allowed to operate.

Yeah, I don't see the point either. There's a fellow near me (I'm
in Northern Virginia) who operates a remoted HF rig via the
Internet.

He calls it "Internet Radio". I honestly don't see the point of it.

It's another way for Internet junkies to undermine the hobby by attempting to blur the line between amateur radio and Internet communications.

The idea is to talk hams into being content to *pretend* that they are using radio when in fact they are stuck off in an elaborate Internet chat. These people get a big "charge" every time they hear that they have succeeded in talking a ham into going off the air, this way.

To these "Amateur Telephone" devotees, the hobby would be meaningless without the non-ham stuff. Packet/Internet gateways, EchoLink, you name it: As long as it takes hams off the air and puts them on the Internet instead, they are all for it, 100%.

Many of the most outspoken advocates of "Amateur Telephone" just happen to work for corporations that stand to gain financially if Hams lose spectrum. Isn't that special? An amazing coincidence, isn't it?

So it it really a bit early to tell, but all the signs point toward good old Dave Stinson AB5S being another "Amateur Telephone" idiot, out to denigrate and undercut the hobby with an offer to "help out" amateur radio with the Internet.

I guess it will be best to wait and see... And if good old Dave manages to denigrate and undercut the hobby with his new proposal, maybe we will get an opportunity to see if he can pick a telephone out of his ass.

Assuming that the intention is to allow multiple simultaneous users to independently tune around the band, the problem is the dynamic range (both in the analog RF front end and in the ADC) and high sample frequency required to transfer e.g. the whole 80 m or 2 m band over the internet. For the 2 m band, 5-10 MHz sampling rate is required, depending on region, and at least 16 bits/sample, so we are talking of data rates 160 Mbit/s, so even the 100baseT Ethernet is not sufficient to carry the signal, not to mention any ADSL connections.

And before anyone asks, no, you can not use (lossy) compression, since this would prevent decoding some of the signals at the user site.

However, a linear satellite transponder has a quite limited dynamic range and a modest bandwidth, so the requirement are far less demanding.

>The system is bi-directional, allowing
>QSOs between stations that normally could not communicate.

It does not make much sense to transfer the whole frequency band to the transmitter. It is much simpler to use a remotely controlled transmitter for each user at some separate location (far away from the receiving site to avoid blocking) and only transfer the base band over the internet.

>If you can't hear weak signals because of noise in your area,
>the concept allows you to build a "remote front end" and
>transport the radio spectrum in a quiet area right to your rig,
>bypassing the problems in your location.
>

>I believe this concept can be the answer to BPL,

If the reason is simply to avoid the local noise problems due to BPL/PLT/PLC and other electric interference when receiving, the transmitter is not affected by the power lines (carrying BPL) running parallel with your transmitter antenna, so why not simply run the transmitter manually from home and monitoring the band using a remote receiver at a quiet rural site.

However, it might not be a good idea to use the BPL to carry the signal from the remote receiver, since the BPL might be blocked during your transmissions and you could not run QSK :-(, which otherwise would be possible using a remote receiver site.

Don't worry about BPL. The ARRL, as with Morse Code, is making
a mountain out of a mole hill. If the military isn't worried about its HF
assets, why should Hams be worried?

I never said anything about transferring the entire band.
At this early stage, I'm only talking about streaming
about 25 KC of any band at any one time.
I'm limiting it so people can use the hardware they already have.
But the concept is "scalable" to larger bandwidths.

> If the reason is simply to avoid the local noise problems due to
> BPL/PLT/PLC...why not simply run the
> transmitter manually from home and monitoring the band using a remote
> receiver at a quiet rural site...
Avoiding BPL is only one aspect of very many.

I guess I wasn't clear-
For those who like Echo Link and what the rude Mr. Blabham
calls "Amateur Telephone," please have at it. Enjoy.
But frankly, I don't give two cents for using an
Internet chat room to talk over *someone else's* radio.

I restore ancient and military radios to original condition
and I want to talk on *them.* Some of them aren't even
capable of being used on ham bands. You'd be surprised;
there's a lot of us out here. With this system, like minded
people can use these radios to QSO completely legally.
If we wanted, we could have a real spark-gap to spark-gap QSO
with crystal detector receivers- in fact,
a whole bunch of such stations in a net-
because we are literally on our own, private ether.

Here's another:
I live in an apartment; I can't have an antenna.
My neighbors have strict restrictions; they can't have outside antennas.
If I use this system, I don't NEED an antenna.
Nor do I need a big, power-hungry amplifier.

Here's another (For Peter's sake):
I love listening to shortwave radio. The power
company installs BPL, and now all my carefully-tended radio
will say to me is: "BSSSSSSSSSSSSSSSSSRRRRRRRRRRRRRRRRPPPPPP!!"
Do I give up, put my favorite radio on the shelf and listen

to them on the Internet "phone?" Hell, no.
I log into a server that's streaming the 31 meter band in chunks
of 25 KC from a quiet location in Itchyarmpit, Idaho.
I pipe that into my V.S. transverter and into the antenna
connection of my radio. Once again I have evenings of
enjoyment listening to Radio Gabbabootoo.
If I want to hear Radio Binga Boinga
and the five other stations around that frequency,
I select the correct stream and enjoy.

I'm not an electronics engineer, guys- just a tinkerer like most of you.
I don't know "47th Order IMD products" from beans,
nor do I know all your wonderful engineering reasons why it won't work.
All I know is I built the simple circuits and it DOES work.
The fact that it's still crude is actually a big plus,
since it opens a new field in which the average,
none-genius amateur can do some meaningful work,
and that's something we haven't had in awhile.

The point is we are using our radios, not a blasted telephone.
And I'll say it again: When BPL is activated, if we don't have
a "work-around," there won't BE a hobby.

There's a quote out there somewhere that says any
new idea will always be met with nay-sayers and
hecklers. That's fine- comes with the territory.

i don't usually have to bypass anything to shoot. you look for last
known good, first known bad, with your RF probe/scope/sniffer/whatever
and go from there. lift an input component leg, terminate an output,
check signal, if good, plug it back in. find the stage that's bad and
check transistor DC levels first.

> at HF
a wire might work
> at VHF
getting dangerous. 50 ohm systems and coax looking good
> at UHF
same as above but remove "getting"

you don't mention max allowed power out and freq. i know what your up
to, but can't remember the rules.

have you considered Mini-Circuits MMIC amps? 50 ohms in and out. if you
need more power, just put them in parallel fed with a wilkinson divider
and flip the divider around on the output for a combiner. alternately,
if the divider legs are too long at your freq, use the coil version. you
could probably get away with tearing open those 75 ohm CATV splitters
and hacking them. you'll loose a little power, but it's doable. a quick
solution.

too much time on radios and not enough on bot killing weapory. quick
solution for that... shotgun?

I wondered that myself. Take note that it's already been done.

Back in the sixties, there were a number of pseudo-academic articles
that appeared in CQ in the April issue, I think under the same pseudonym.
There was one about using phone lines for amateur radio, complete with
"DXpeditions" to exotic countries. It was voice, but it had an odd
similarity to the internet. I can't remember, though, if this was in
the early sixties, my guess 1964, or the late sixties, likely 1968.
It's not like therre were a lot of April issues in that decade, so someone
with a complete set (and in order) could check. They threw in some archive
photos, and plenty of official sounding titles and committee names, so
it came across really well (unless you got suckered).

Actually, Dave, something like this idea was proposed by
George Gilder back when "TV over the Internet" was a hot
topic.

Gilder proposed that the Internet providers simply bring
a fiber-optic cable to one's doorstep and stop there. The
fiber would be "dark". But any light you launched into it
would come out the ends of all the other "dark" fibers -
all over the world. In effect, the Internet would become
an extremely wideband virtual ionosphere for optical waves.
And, of course, at optical wavelengths, there are huge
frequecy bandwidths available, so everybody could have
their own TV channel, or ham band, or whatever. The trick
would be that you had to provide your own optical terminal
equipment to interface to the fiber.

The point is, your scheme isn't as far-fetched as it at
first sounds. I still like the "old-fashioned" iononsphere
for radio propagation. But your observation about the
increasing number of restrictions and interference sources
amateur operators are encountering in pursuit of their
avocation is quite relevant to the current state of affairs.

Agreed. And that's what I'd do in practice.
I'm just curious, however as to what effect jumping RF from point A in
a circuit to point B with just a single wire has on the signal. IOW,
will the integrity of the signal be preserved by this quick and simple
expedient? The great and the good here seem to believe it shouldn't be
a problem up into VHF.

a) i am not proposing a direct direct conversion. i am proposing an up
conversion exactly like han's MK1. for the second conversion, i am
suggesting a direct conversion to base-band from the high IF. as you
rightly point out harmonic mixing is a problem with broad-band direct
conversion receivers, therefore, you need to have a low-pass or a
band-pass ahead of a diode mixer working as a product detector.
b) my second suggestion is to do the logarithmic calculations
digitally on the PC. that will simplify the design.
c) as for the granuality of the sweep, for finer resolution the sweep
range will be decreased. that is one way to get higher resolution, the
other is to slow down the sweep.

what kind of a VCO are you using? and how are you ensuring that the
vco output remains constant throughout the sweep? i expect that the
VCO's amplitude will also effect the first mixer gain.

Hi,
Well, I'm really confused.
I simulate a simple serial R-C-L-Network (all in series).

As far as I know the total (input-)Impedance of the network is:
Z = R + jwL - j/(wC) resp. the resonance frequency (where Zin=R) is
1/sqrt(L*C).
At resonance frequency, the Impedance should be real and therefore in
my hummel opinion Voltage and Current schould be in phase.

The funny thing is, when i build up such a network in Schematics
(Cadence PSD 14.1/Orcad 9.2) and simulate it with the PSpice A/D
Simulator, the current is displaced (relative to the voltage) about
lambda/4 - obviously not in phase!?

Can anyone tell my where I made a mistake?
Or why this Problem is showing up?
Thanks to anyone reading this and especially to those who post
answers.
D. Stutzer

The impedance should be R + jwL + 1/(jwC)

where is here? W7EL stated it might be. if it's just to jump a signal
over, a wire or piece of RG-58 might be ok.

good name. i saw a beast in with the educational exhibits at the state
fair recently. can't remember which competition it was in, Battle Bots
or what. it had a thick piece of steel cut as a lawnmower blade on top.
i'd love to see it up against a bot that just got under the blade and
ran it through with a skewer, but it was some pretty thick plate.
couldn't see much in the way of electronics, just a bunch of thick metal
partitions with heavy wiring going to the hulking motors. it looked like
a lot of other bots with the sloped sides to get under the enemy.

brs,
mike

David,

Your idea is certainly technically feasible, and would provide a way for folks to continue to 'use' obsolete radio equipment in a post-BPL era. Similar in many ways to the micro AM transmitter that I use to broadcast old-time radio programs to my antique radios, for demonstration purposes.

Somehow, though, it wouldn't be the same. DX-ing and shortwave listening are, for me, pursuits which are made interesting by the sheer randomness of long distance radio communication. Things like building a better antenna or tuner, or waiting for the window to open to that country in order to catch an elusive transmission - that's where the fun is!

Internet communications, however, are carried over the same high-reliability global networks as telephone calls. From my keyboard, I can DXCC in probably under half an hour - which would be a very unfulfilling task, given the certainty of the medium. And that's why I have no interest in some of the existing Internet/Amateur Radio interfaces, such as IRLP - sure, I can talk to some guy over in England on my 5 watt 2-meter HT using a local repeater and dialling an access code to his local repeater - but it isn't DX, its more like a telephone call to a random party at the destination over the Internet. More like using VOIP to call a pay phone in England, then talking to whomever answers. To me, that ain't radio. It's a phone call. Nothing more.

Your proposed interface would provide a way to simulate real QSOs on the old equipment - but it would not be 'real'. Not much different, really, than building a Telco interface for the radio, dialling up the far end, and pretending to have a radio QSO using the mike and speaker instead of the handset. A radio simulator of sorts, with a real boatanchor configured like a speakerphone at each end - but just a simulation nevertheless. Not a true radio QSO. I could wire up my electric pencil sharpener with a mike and speaker, and establish a QSO over the Net with somebody on an ARC-5. That don't make it a radio, though!.....but it would look kinda cool ;)

Some will find this interface quite acceptable - if conversation with others is what the hobby is about for them, this will provide a nostalgic way to continue to QSO with familiar radio equipment. 'Whatever floats their boat'.

For those of us who chase DX and foreign broadcasts through the ether or thrive on overcoming technical obstacles, however, I suspect that our interest would not be held for long by such an interface. Just like piping 1941 Jack Benny programs to my AK-55 - cute, but it doesn't make it seem like it's 1941. Great for demonstrating the set to guests, though - after half a minute or so, their interest is dissipating and the AK is switched back off.

If BPL becomes a reality, my HF gear will be going up on the shelf with the other old radio equipment - to make room for the satellite and moonbounce equipment that will take its place.

YMMV, of course...

73, Leo

I'm not sure that it is necessary considering the base of information
on spectrum analyzers of all kinds that have been available for over
a half century, nearly all built for military/commercial markets..

22 years ago, Intel had a nice little audio range spectrum analyzer
as a laboratory development breadboard-trial thing. Used NO "sweep
oscillator" but simply sampled the audio input and did the necessary
math calculations to convert from time domain to frequency domain.
Quite obviously Intel was promoting their microprocessors in a (then)

new niche application. However, that little spectrum analyzer was about as direct-conversion as could be possible. Many, many home entertainment market music systems now build in such spectrum analyzers and show the coarse bar-graphs on front panels in real-time displays.

Given that time now is two decades later with companies such as Analog Devices marketing a number of very fast analog-to-digital converters AND wide dynamic range true logarithmic detectors, a single-conversion spectrum analyzer with a personal computer as the control and read-out can be a viable home project.

To Ashhar Farhan:

..."warming up the soldering iron" and getting going on it is NOT a good thing without a lot of other considerations. First of all, one must have some personal computer program development capability to write the GUI program to show the output display. That is NOT for beginners in programming. Secondly, any sort of DSP program set MUST be done according to DSP math and with known levels of input to a digitizer. Understanding the guts of DSP processing is a prodigious project all by itself.

Third, one has to have some sort of planning ahead of time on what is expected in performance of this spectrum analyzer: Range, band-width, dynamic range, resolution, accuracy. Performance of ANY of those criteria will be affected by the ability to design them into the project AND at what cost. Such things do not assemble like Lego blocks.

Fact: Direct, real-time spectrum analysis exists in audio/music system equipment and has for at least a decade. House-number single IC packages exist to do that analysis and drive simple displays at relatively low cost.

Fact: Digital sampling oscilloscopes today handle 500 MEGA samples per second with resolution exceeding 8 bits per sample. Display of stored digitized information is integral to the oscilloscope, now commonly done on an LCD flat screen. Cost is releatively high.

Fact: DSP techniques, algorithms, ICs exist today to enable frequency conversion, sampling, filtering to be done at releatively moderate to high cost.

Combination of any of the above is possible to make a truly direct spectrum analyzer or single-conversion analyzer with an input range up to VHF. The concept of truly direct spectrum analysis has already been done as a consumer market item accessory. DSOs of today from Tektronix and LeCroy already contain varying degrees of DSP built in. The development of such a spectrum analyzer will be time-consuming and not, in my estimation, an easy project for the casual home hobbyist.

Paul, there seems to be some disagreement on the practical
aspects of breadboarding tests...if what you are doing is such.

First, there is always the possibility of "trouble" with "long leads"
at HF or higher. Without knowing more exact nature of a particular
circuit/system under development, it is IMPOSSIBLE for others to
predict what will happen. Too many variables to allow quick solution.

In the consideration of PRACTICAL bench work during development
(my assumption), AND of having a circuit board with a "good" (large,
inclusive) ground plane, it is quite probable that one would not
experience undue upset of a circuit/system under development
involving frequencies on up to UHF with "long leads" of up to 4 inches
length. That is my particular experience from longer than four
decades of working "on the bench" both at work and at home.

Others may wish to take exception to my statements and engage
in long, convoluted intellectual arguments about the whichness of
the what. That's okay with me. But, on the subject of ACTUAL
development, especially getting something DONE, all the jawing
about the whichness of the what isn't helping much. No time on
the bench. Trying out things may involve bypassing stages or
similar. Fine, sometimes that is the only way to discover what is
not quite right, troubleshoot, or just see alternate possibilites.

It's rather obvious that a single wire elevated above any ground
plane that may be an eighth of a wavelength long or so is NOT

going to be of the same impedance as the same wire laid down
next to the ground plane. But, will that matter? Depends. If the
load end has a low impedance near the source impedance value,
probably not. If the load end has a high impedance relative to
source, there might be some nasty effect. One has to THINK in
all cases, all situations, in terms relating to the particular project
in work. In development work with limited time available, one goes
ahead and tries something out...and looking, learning, discovering
what happens and getting a handle on the differences of the longish
jumper versus short-lead connection. Each and every project is
going to be different, unique, and none will have any ironclad rules
of "this is the one and only way to do it."

A case in point, mentioned in here before: Hans Summers' spectrum
analyzerS (plural). His first version was point-to-point using relatively
"ugly" (top foil of a PCB only, no etching) structure. That worked, but
no doubt he had some individual, spot problems here and there. For
the second version he went into modular style separation of basic
blocks connected with little coax cable assemblies. That modular
style can be considered the "best" for shielding, maintenance of Z
between stages (important for broadbandedness), and ability to
localize troubles should one module not behave. That's excellent, but
with a qualifier: It isn't practical unless one has a low-cost ready
source of coax cable assemblies and mating conntectors. Hans had
that from finding a local bargain in them. Already assembled, no extra
time required for those, quality control could be expected to be good,
not a lot of worry about open center contductors, and so forth. The end
result was neat, tidy, with less problems from construction compared
to the first. Development time could be concentrated on the interior
of each module and those characteristics rather than a lot of relatively
open hook-ups.

There's one rule that all have to keep in mind: Electroncs, fields, and
waves don't recognize "neat" or "pretty" or "approved ways." They
work with conductors, insulators, impedances, etc., on THEIR terms,
not humans. Everyone has to get acquainted with electrons, fields,
and waves' rules FIRST.

"Ugly" circuit board structures are just fine if the solder makes good
conductive intermetallic bonds, doesn't short out to other lines, doesn't
have a potential for near-future trouble from oxidation, coming loose, etc.
Neat it ain't, but electrons don't work on neat.

Sorry to get on the philosophical lecture pulpit. Other things locally
got me on a roll and I slipped in the butter...

Let me get this staright.
I have Internet with "terminal" - my computer which can display color movies, sound, etc.
Now "Virtual Spectrum" will allow me to use piece of crappy radio over Internet?
Why?
Seems like having Rolls-Royce, but instead of riding in it, I'd rather just push it around?
Far out!

Source record: 31838

I did a little experimenting today with my assortment of Iron Powder Torrid cores. For those who care;
39 turns on a T-157-2 core got my 102 inch CB whip on the 60 Meter band. SWR was about 2.5:1. A 2 - 20 pf cap from the antenna side of the inductor to GND will probably get it to 1:1 though I haven't bothered to try this yet.

Have fun

2673. Navy radarman question

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-10-14 21:59:55 UTC
From: hexter@blazenet.net
Message-ID: <voosersb3faa6@corp.supernews.com>
Source record: 31840

Did radar operators fall under 'radioman' rate, or was there a 'radarman' rating? I don't see it as a separate specialty anymore. Is it now in the 'information technologist' rating?

What letters would have been on a Chief's name badge?

Such as

RMCPO K. Smith

or would it be more like

RMC K. Smith

Full first and last name, or just first initial?

Thanks for your help, and also your service to our country.

Not mine. Not if I can possibly help it.
I can't stop BPL, but I *can* get around it.
And what I'm proposing does not preclude what you want.
Let's say BPL does come to your area, and
all HF sounds like a buzz saw.
In your case, you still have your transmitter there at your house.
You use a remote front end, and stream the portion of the DX band
you want to work from a friend's house out in the quiet country.
The only difference is that your receiver is effectively offset in
location
by a few miles. That isn't going to make finding that weak
DXpedition any less challenging, but it *will* make it possible.
Otherwise, it's give up the ship entirely. There's no need
to give up your enjoyment; You just have to be a little flexible
to work around the problems these numbskulls throw at us.
Afterall- haven't we hams been doing that for a century?

Bob,
Jezzzz, give the guy a break. He just lost his friend and your bitching about a covers, mic and manuals.
Maybe Jim will come over and install them for you also.
Offer the guy's family $5.00 bucks. You just want the stuff for nothing.
I see it time and time again. Slime like you hang around waiting for a ham to pass on
and then you want the equipment for practicly nothing. Then you sell off the stuff for a profit.
You make me sick.

And Jim, Sorry about your friend. You should take some digital pics of the equipment and put the stuff on Ebay. There you will get the most money for the family.

73 and good luck!!

Which voltage and which current? Clearly the voltage across the
capacitor will always be pi/2 relative to the current in that
capacitor, and the same (but opposite sign) for an inductor. Also,
are you doing an AC or a transient analysis? If transient, are the
transients settled, are you really on the resonance frequency, and are
you simulating with sufficient time resolution? Oh, and I'm not quite
sure what you mean by "lambda/4" phase shift. Is that degrees or
radians, and what's lambda?

Cheers,
Tom

http://www.timewave.com/Acrobat/ANC_4TW8x11a.pdf

The schematic is on the last page. Has anyone here worked with a similar circuit? I'll explain what little I do understand so you can build on this.

My questions:
1. What is the Q1 transistor for? Is Q1 an amplifier or just a buffer? At DC, I notice that it's fed by a supply voltage just under 12V (only 20 ohms and some inductance away from 12V). The CR1 and CR2 diodes, of course, are there to prevent overloading from unexpected large signals. Capacitors C3 and C2 couple the RF to ground. I assume that R3, R4, and R8 play a role in determining the gain. (I can't remember enough of FETs to show the exact relationship.) The RF output must be the voltage across T1 and is not connected to ground. The inductance provides RF impedance between Q1 and the power supply.
2. What does transformer T1 do? I notice that the not-quite-12V DC (I'll call it 11.8V DC) is connected to two of the T1 windings. So if the input of T1 is .01V RF, it extends from 11.79V DC to 11.80V DC. Then the output would extend from 11.80V DC to 11.81V DC. Until I get an answer from Timewave, any idea what the turns ratio and inductance values might be? Does it play a role in the noise phase adjuster? Do I need to treat this as a current transformer rather than a voltage transformer?
3. How does the noise phase shifter work? How does noise phase shifter work? Adjusting the value of potentiometer R6 is supposed to change the frequency response. The phase shift should vary between about -pi/2 and +pi/2 depending on how the pot is adjusted, but I'm not getting anywhere in the simulations. The FREQ RANGE switch should control where the phase shift equals 0, but I can't make any sense of this, either. Unfortunately, information on the transformers is not provided. But even assuming 1:1, 10:1, and 1:10 turns ratios on FT50-43 toroids isn't helping. I must be thinking about the circuit in the wrong manner. The adjustment for the noise gain seems straightforward enough to me - the pot controls a simple voltage divider.
4. What is the Q2 transistor for? It's also fed by a supply voltage just under 12V (only 10 ohms and 2 inductors away from the 12V power supply). Capacitor C8 seems to be like capacitor C2 - coupling capacitor. I guess R9 and R10 play a role in setting the gain, like R8, R3, and R4 in Q1.
5. What does transformer T2 do? The strange thing is that the DC power supply is connected to the OUTPUT winding. I'm lost.
6. How does the noise gain work? Is the R12 pot a simple voltage

divider? I notice that C11 lies between R12 and Q3, so it has no DC connection to it. I also notice that part of this pot is in parallel to R37.
7. What does Q3 do? I don't remember my BJT transistor theory very well either. The collector is 2 inductors away from the 12V power supply and is thus connected at DC but isolated at RF. C12 is a coupling capacitor, so R16 plays a DC role. R13, R14, R15, and R16 determine the gain.
8. How exactly does T3 work? Again, there is a DC supply voltage on the output side.
9. What does Zener diode CR12 do? Do it, CR4, and CR3 play a role in dealing with unexpected large RF signals, or am I off base here?

I don't yet understand the T/R switch at the bottom left of the page, but I'll save that for another post.

Multiply top and bottom of 1/jwC by j (This does not change its value) and you get 1/jwC = minus j/wC.

Back to school with your algebra.

His algebra looks perfectly fine to me. But as others have pointed
out, he's left the 2pi out.

Is this part of your research for your post graduate work,
or were you doing something on DSP? In any event, thanks
for posting the schematic! I'll look at it in detail when
I can, but I'll comment on the xsistors: for the FETs, the
voltage (signal) at the gate controls the current thru the
source-drain. For the bipolar, the current at the base
controls the current thru the emitter-collector. All of
them are amps that drive the transformers. At a glance,
the xformers appear to be auto-transformers to boost the
signal voltage.

Yes. I apologise for my remark about school. I gained the incorrect
impression from the previous replies.

The w in wC stands for omega = 2*Pi*F, the angular frequency.

I can't see a receive path from the antenna through the
circuit to the if amp. - looks like the back to back diodes
on the right side of the mixer block the path. On TX,
I can't find a path from the DSB sig to get to the input
of the mixer - the back to back red diodes block that.

Radio and Radar were separate ratings back in 69-77 while I was in.
Both were primarily operators and the ETs (Electronic Technicians) did
all the repair work.

I was never stationed anywhere that used name tags. But RMC K. Smith
would be the normal mode of address.

With a less pompous start, you might have gotten some more favourable
comments :-).

The problems with high noise levels is of course real for many radio
amateurs and shortwave listeners living in urban areas.

For a few years there have been remotely connected receivers connected
to the internet which can be remotely tuned to any desired frequency
and the audio is transferred over the net. The problem is that only
one user at a time can control the receiver.

However, in order to create a shared receiving station in some quiet
location without huge hardware duplication for each user, would
require that entire bands are digitised (with dynamic range problems)
and the whole band is then transferred to each user. Some DSP software
running in each end user computer would then do the filtering and
detection. If some kind of multicasting is used from the receiving
site, this would give an unlimited number of shared user for each
band.

The other approach would be to digitise the whole band and run
multiple virtual receivers in software, individually controlled by the
remote user, producing a baseband signal, which is then transferred to
the user. The number of simultaneous users would be limited by the
number of virtual receivers (limited by the hardware computational
power) and the throughput of the shared receiving station internet
connection, requiring 10-100 kbit/s for each active user.

A shared remote receiving station is not very compatible with
transmitters on the same site, so the users would have to use their
transmitters at home or pool a number of transmitters on a separate
transmitter site, at least a few kilometers from the receiving site.

Of course the simplest, but not always the most cost effective solution is to have a summer cottage with a broadband connection in some quiet rural location. Move your station to the cottage and when not at the cottage, connect a remotely controllable transceiver to a computer (audio in and out, serial data and PTT) and control the station from your urban home. A remotely controlled antenna rotator also helps a lot. In this way you do not have to suffer from noise, antenna restrictions and neighbours complaining about interference:-). Using some watchdog timers is a good idea, in case the computer or internet connection crashes.

now that were all done playing with j...

don't forget

Z = sqrt{R^2 + [(wL) - (1/wC)]^2]}

and

Z(s) = R + Ls + 1/Cs

which is just plain easier to deal with 'til you need to journey back
into time domain land. no need to leave it f(t) for this deal, though.

all that j stuff... that was scary shit. so easy to make a mistake.
swapping w and f is another good one. only works for f/f stuff.

mike

Especially so given the limited typography of this particular medium.
I suspect few of us would have a problem if we could only view these
formulae in a suitably appropriate typeface!!!

> rightly point out harmonic mixing is a problem with broad-band direct
> conversion receivers, therefore, you need to have a low-pass or a
> band-pass ahead of a diode mixer working as a product detector.

That wasn't the effect I was worrying about... after all your up mixing and
direct conversion of the VHF IF down to baseband, and low pass filtered it,
you'll end up with say 20KHz of audio baseband to feed into your soundcard.
Unfortunately your sweep rate is also down in the same range. Which is a
problem because whatever method you use for envelope detection of the
baseband will have to react faster than the sweep rate. Though as I say, if
you do it all in software you might be able to untangle it.

> b) my second suggestion is to do the logarithmic calculations
> digitally on the PC. that will simplify the design.

It simplifies the analogue design and complicates the software. 16 bits of
resolution should give adequate dynamic range. Depends what you want to
spend time on... The AD8307 chip is very easy to use, if a little on the
expensive side.

If you have to use the PC to unwrap the envelope detection mess as mentioned
above then you have to do the logarithmic bit in PC anyway.

> c) as for the granuality of the sweep, for finer resolution the sweep
> range will be decreased. that is one way to get higher resolution, the
> other is to slow down the sweep.

Agreed, but if the widest resolution is only 20KHz, then you have to do
5,000 samples to cover 0-100MHz input bandwidth. This fine resolution is

imposed by the relatively narrow bandwidth, otherwise you will suffer significant loss of accuracy on your displayed result. The way I think of it is in terms of frequency spikes falling into the holes between samples. In the extreme imagine taking a VCO going in 100 steps, so making an amplitude measurement at each 1MHz of the range 1-100MHz. Your bandwidth 20KHz. Signals exactly on the MHz will be no problem. But what about a signal at say 12.5MHz... what does it look like on the analyser? It's 500KHz away from the centre of the 20KHz passband for both adjacent measurement points 12MHz and 13MHz. It's fallen into the hole. What you'd see on your display depends on the skirt selectivity of your filters. If you're using a 20KHz soundcard as the filter, the skirts will be quite sharp, so it's likely you'd see almost nothing at 500KHz baseband. This would mean the majority of frequencies in your input spectrum would be absent from your display or at entirely the wrong amplitude.

>
> what kind of a VCO are you using? and how are you ensuring that the
> vco output remains constant throughout the sweep? i expect that the
> VCO's amplitude will also effect the first mixer gain.

I'm just using the internal oscillator of the SA602 mixer/oscillator chip. As you suggest, probably not at all constant ;-)

> home hobbyist.

Interesting ideas Len. I guess the idea of an all-digital spectrum analyser is similar to that of an all-digital HF amateur radio tranceiver. It can be done but at the current state of the art, it's a difficult proposal for the hobbyist and certainly difficult to obtain the same level of performance as the equivalent analogue device for the same amount of cost and/or effort.

I think it is feasible to use an analogue RF front end under computer control, the a PC controlling the VCO and sampling the logarithmic output. In essence just replacing the oscilloscope as the display system.

Which does return to Farhan's original benefit mentioned, of making a PC based analyser that's easy to assemble and use for hams without expensive oscilloscopes.... which I have to say I'm doubtful of. My analyser works very nicely with a cheap low bandwidth (5MHz) oscilloscope, no expensive one needed. Such scopes are extremely cheap on eBay and elsewhere, practically considered scrap metal. Definitely cheaper than a PC, and without all the attendant problems of software installation, maintenance, virus protection etc etc., that you have with a PC. My oscilloscope works from the moment I switch it on (well, after a few seconds for the tube to warm up!), without any need to run any installed software etc. I don't think you can get easier than that! Like my "old-fashioned" paper based log book. It's always there ready to use, its hard disk never crashes and its more portable than the lightest of laptop PC's. Just some of the reasons why here at G0UPL I have a computer-free shack ;-)

I say go for it !

Ignore the doubters and those that don't like the idea. just go for it I say.

It's a good idea and a fully workable one, I've been a hardware/software designer for years and theirs nothing that's so difficult in the idea.

Though what I'd do is for the unit to have its own fast ADC - at least 18-bit. and it's own little cpu - ATmega's are nice and easy to use. Then send the current freq and log level down the RS232 port to a PC.

Happy experimenting !

Clive

Hi chaps,

Heading sums it up. I'm using a 74HC04 to 'square-off' a sine wave,
but it's causing a fair amount of ringing on the output signal's highs
and lows which appears to be finding its way through to the eventual
final stage. How do I best eliminate (or at least drastically reduce)
this nuisance? The square wave frequency is 8Mhz., btw.

Thanks,

p.

If you put a low inductance termination resistance right at the pin with
no wire and a low inductance bypass cap at the power supply and properly
introduce the signal to a scope, is the ringing still there? If it
ain't, the chip ain't causing it. Does the output ring with a square
wave input? Ringing is often more about the
interconnect than the chip...often...not always...
Oscillation, which can look like ringing is often about the input drive
for low dv/dt inputs.
Observed ringing, as opposed to Actual ringing can also be all about
measurement technique.

Can you be more numerical about "fair amount"? Amplitude and frequency
of the ring? Getting rid depends on how much you got and how much you
can stand and what you're driving.

Layout, layout and layout.

Decouplers close to chips, short ground leads. Also be quite certain
that the ringing is really there. Ditch the ground lead from the scope
probe and make a very short one by wrapping stiff wire round the earth
ring at the end of the probe and leaving a piece as long as the probe
tip sticking out. Get up close to the chip signal and ground pins and
see if the ringing is gone.

>sure what you mean by "lambda/4" phase shift. Is that degrees or
>radians, and what's lambda?

Since he calculated the resonant frequency of the circuit using

f = 1/sqrt(L*C),

his answer will always be a frequency 6.28 times higher than it should
be, so the reactance of the inductor will be greater than the reactance
of the capacitor, making the phase angle positive.

"Lambda" is usually taken to mean wavelength, so "lambda/4" would mean a
quarter wavelength; in this context, 90ï¿½, the approximate phase
difference between his simulated voltage and current.

If you have log before ADC I think you need a superhet conversion rather
than direct conversion to baseband, for the reasons I mentioned earlier. If
you just ADC'ed the lot there'd be some chance of sorting the confusion out
in software, though it'd take a brave heart to try it.

what pre tell, is a typeface that would make it hard? wing-dings?

i admit, even in HTML with arial or fixed-pitch, where you have sub and
super tags and greek letter codes, you can't do much. i tried a few free
math notation tools for HTML and wasn't happy. plus you need a plugin
for most if not all. W^3C has a standard. i'd like to see more math
capabiliies in browsers. we could attach formulae without violating the
no bianaries rule. of course microshaft and standards will probably
never be seen in the same line of code.

i still don't see why text based math legibility is font dependant. i
see i could have eliminated some clarifying parens by

Thanks Don. I'll try that suggestion. I've read Mike's reply but I
think he's pretty much saying the same thing as you.
I've ended up with a decoupling cap that straddles diagonally over the
top of the IC. For some reason, on this chip, the supply and gnd pins
are on opposite corners, which is a nuisance, so the cap's leads are
longer than I'd have liked. I suppose this sort of situation doesn't
help?

I was once called down to the production testing by a newly hired tech with a
similar complaint of excessive ringing. Turned out that the scope was grounded
to the circuit by a separate banana lead. The scope probe ground was removed
"because it was is not convenient" although there were plenty of local ground
point provided on the board. There was some residual ringing in his ears
afterwards.

How about swapping the '04 for a '14, AND make sure it is properly
decoupled?
Maybe the '04 is getting a little funky in the zone between a valid high
and low?

Paul Keinanen wrote:

> With a less pompous start, you might have gotten some more favourable
> comments :-).

I certainly don't mean to be pompous, at least on this matter.
I've tried to make clear in the body of the post that
I'm not the brightest candle on the cake, that I
want to get the idea out so people with more talent
than me can work with it.
As for the unkind comments of a few:
Hecklers, cynics and naysayers greet anyone who proposes something new.
It comes with the territory.

> For a few years there have been remotely connected receivers connected
> to the internet which can be remotely tuned to any desired frequency..

Yes, Yes... Am I just not being clear, or are people not
closely reading that to which they reply? Probably a little of both.

We don't WANT to talk over an Internet telephone line
to some remote base station.

That's not the point.
Please read it again:
That's NOT the point. < (repeat as necessary)

We want to *use our own equipment, right here.*
Noise, antenna bans and LEGAL restrictions
have kept us from the work we want to do.
This system gets around the obstacles by creating
a second "ether" (ionosphere, etc.; pick the term you like)
which you control and *you* regulate.
The two main points are:

1. To make possible radio operations of any kind that
were once impossible, for any number of reasons.

2. To "harvest" clean spectrum in a quiet location and
bring it to your receiver, so you can continue
your radio hobby regardless of what BPL or any
other interferance source does to your local radio environment.

The system is intentionally simple and limited,
so lots of people can tinker with it in short order.

I have faith that those many people
who are sharper than me will expand the concept.

I've had a heck of a lot of fun working on this.
Especially enjoy the ability to record radio spectrum.
I have one hour-long segment on CD centered on 3932 KC.
It contains seven separate, distinct and interesting SSB QSOs
that I can listen to at my leisure, plus many other stations.
And a lot of us military radio people think having a
nation-wide net of WWII BC-611 handie-talkies,
all able to talk to each other in real time,
would be an absolute gas.

Here's something cool: I've long been involved in longwave
work on the 1750 meter band (160-190 KC). This winter,
I plan to take a laptop and a V.S. remote front-end
to several locations and record an hour or so of the band
from 170 to 190 KC. I can then take them home, run
the recordings through a V.S. transverter, and hunt for
all those weak LOWFER signals in the comfort of my own home.
It's still just as challenging to find them, but I get some
major advantages. First, I'm not off on frequency "A" and
missing an opening to station "B;" I can "rewind" and go
look for him, too. Second, I'm not sitting in the dark,
freezing and trying to tune my audio filters with numb hands.

Anyway- it's a tool people can use if they want.

So use 2 18-bit ADC's (sound card maybe 16-bit but you won't get 90dB range from it, you'll find a fair bit of noise from your average sound card - well the first 3 bits will be noisy), one with the I and the other with the Q (from the DC output) and do it that way ?

Don't even try. Buy a small quantity of Deoxit, available at electrical supply houses. It is a bit pricey, but the smallest quantity will last for years (it is used VERY sparingly). It is unquestionably the best contact cleaner/lubricant that has ever been made.

I have a PC-based oscilloscope that does something pretty close. It
digitizes at the rate of 4ns per sample (taking 8bit samples
unfortunately) and generates an FFT display of magnitude/power
spectrum/power density).

> I think it is feasible to use an analogue RF front end under computer

> In essence just replacing the oscilloscope as the display system.

I guess, it is not necessary to PC control the VCO. Sweep generators
are easy to come by. probably, if there is a way to feed the sweep
into the PC to generate the X-axis, then that might be a better
alternative.

i just ran a check with the sound card:

a) the sound card contributes noise. i shoved in a 50 ohms resistor into the mic input, cranked up the mic level, save a 'silent' wave file and saw it through a hex editor. There is a random noise of about 2-3 bits. That means, the effective range is not 16 bits but 12 bits. 12 bits can represent 4096-1 as the highest number. That means, the dynamic range is 4096 squared: about 16 million or 72db. A little low really for interesting work. there isnt enough 'roof' to resolve a spur about 60db down without touching the grass

b)the sampling is at 44khz. some of the posts got confused between 20khz b/w and 20khz sampling rate.

hans is right about the PC being a kludge when compared to an oscilloscope. I live in India and second-hand oscilloscopes are a rarity. The new ones cost an engineer's whole year's salary. I have purchased a tektronix 454 last month on ebay for $300, it is still on its way to India. So, while i can imagine that in a number of more developed countries oscilloscopes are not really a problem, they do remain a problem in many parts of the world.

More often than not, an amateur already has a PC. Adding a simple hardware to be able to do quick and dirty spectrum analysis might be an interesting option. As Wes writes in SSD and EMRFD, the purpose of test instruments is to help with the projects on hand, rather than be projects themselves (then he went on to homebrewing a spectrum analyser, hehe).

Martin,

Why do you want to take it apart? Is the fold over cracked? (they are infamous for that.) I have 2 former fold over masts that I cut the knurl off and slid a tube up over the joint. A couple of rivets and a sprint load at the resonator end and I haven't bent one yet.

2730. CQUAM stereo decoding

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-10-15 23:11:42 UTC
From: tech.stevea@talk21.com
Message-ID: <c5e0f038.0310151511.74796d21@posting.google.com>
Source record: 31896

I am looking to develop / build an AM stereo decoder, for 455kHz.

1. Can anyone point to a reference of how to decode CQUAM using standard RF building blocks (eg. multipliers, PLLs, filters).

2. Motorola seemed to make IC CQUAM stereo decoders (MC13320, MC13322, MC13328). Does anyone know if these are still available, and if so, WTB?

3. Does anyone have any datasheets on the chips mentioned above?

Cheers,

Steve A

2731. Electrolytic caps question

Newsgroup: rec.radio.amateur.homebrew

I have obtained some surplus linear regulated power supplies. The
date code for the electrolytic caps in the filter section are late
1993. I've not powered these
supplies up. I know that these caps have a limited life. These caps
are also
harder to come by due to the proliferation of switch mode power
supplies and
their lower values. Any ideas/suggestions to minimize stress to these
caps
or even rejuvinate, if possible, these caps. I'm aware of inrush
current at
supply turn on and I plan to minimize that. Any other ideas or
suggestions???

You have three choices:

1. Bring the things up slowly, on a variac. This allows the capacitors
to slowly reform.

2. Bring the things up for a while with a 60W light bulb in series, then
apply full power. Same basic principle, if you don't have a variac, but
slower.

3. Apply full power. If any caps blow, they were marginal and should have
been replaced anyway.

I tend to be a fan of method #3, but I can understand the arguments in favor
of the first two. But caps that are only a decade old? Don't sweat it.

Richard,

I don't know if you ever got the response you needed on this. In my quick scan of the responses, I did not see any references to the very common use of HF/SSB as a transport for E-Mail in the maritime services. Of course, I'm not sure how picky they are about your station being on a floating platform, so that may be a problem. That said, I believe INMARSAT started out as a tool for the high seas and is now used by everyone and everywhere. If that does not work, check out the available equipment and perhaps seek an experimental license to explore and invent a new service.

You might try the following:

http://www.marinenet.net/

http://www.cruiseemail.com/locations.html

http://www.sailmail.com/

http://www.yachtcom.co.uk/SSB-email/

http://www.shipcom.com/email.htm

http://www.hfradio.com/

http://www.rodgersmarine.com/links.htm

http://www.globewireless.com/

These are a few URLs that may point you in the right direction. Much of this is aimed at the casual sailor on a small sailboat or yacht with modest power (100-250 Watts) and a vertical whip antenna, so it is pretty basic stuff.

This is in essence what NSA does with as much of the RF spectrum as they can, all over the globe. They have no idea what they have, but if you can tell them the time, the general location, and the frequency, they will hook up a receiver onto their data log, and look around for the signal. This is just what they did when that KAL plane was shot down, and NSA came up with the com signals of the fighters that did the deed.

Actually, I'd be tempted to rig a phasing type conversion to baseband from the 300 MHz or whatever the first IF is....

At best it might get 40-50 dB of suppression of the other sideband, but it would remove most of the undesired spurs and something like an AD8307 log detector could be used to convert to a DC level.

After that, feed it into an A/D converter and into a PC using the printer port.

Given a dual channel A/D converter, I'd also sample the tuning voltage for the VCO and feed that into the PC as well.

All of this would move the programming from a possibly complex DSP problem to a relatively simple Parallel port input and then number crunching to a display.

There would be spur responses 40-50 dB down, but generally speaking, it should give useful information.

==========

Granted, one problem is how fast the data transfer is through the parallel port, that would limit how many samples/second the system could process.

There is the second issue, about maximum sweep speed Vs the IF bandwidth, and the maximum useful bandwidth would be a function of the Phase shift detector system. Still, I think this approach has some possibilities.

Almost forgot... WIN XP and WIN2000 make getting to the parallel port for something like this MUCH more difficult then it was under WIN 98.

You could use RS232 and perhaps two COM ports to allow getting the AD8307 and the VCO sweep voltage in parallel, so to speak. Once again, it would be a limit on how many samples per second the systme could provide.

If you want to be more complex, you could feed OUT commands to a synthesizer to tune the VCO and this would allow really slow sweeps and very precise accuracy, but it complicates the design.

I have to admit, I've been looking at the synthesizer design John Miles, KE5FX, did which tunes from 1 GHz to 2 GHz with very fine tuning steps and all osrts of ideas for various test gear built around it keep dancing in my mind. I suppose I should see if I can build one and get some idea as to the cost and so on. But it'd make a wonderful starting point for a digitally tuned spectrum analyzer !!!

Admitted, the close in phase noise could limit dynamic range 'way below the range pssible with an AD8307 detector, but even so the frequency accuracy of an analyzer would be fantastic.

=========

Overall, Avery is probably correct that the result may be a lot of work an less than perfect performance, but as a homebrewer it does seem like a fun way to get something fairly useful and learn a lot as the project goes on.

Not only that, they decrypted the secure voice! If you listen to the audio
you can tell it was originally narrow-band secure voice, which was common
in the Soviet Air Defense forces and interceptors.

Having the PC control the VCO via a digital-to-analogue converter gives the PC a lot of control over the sweep rate etc. You could then control the sweep rate, and zoom in on areas of your choice, via the PC rather than analogue controls. But either way would work fine. You can feed the sweep into the PC with a simple analogue-to-digital converter no problem.

a four bit
> microprocessor and produced by a two bit company."

The 'HC and 'AC families (at least the simpler parts) can be made to
give
extremely clean square wave outputs, but as Don and Mike say, you
have to be careful.

The decoupling cap you mention above sounds like a leaded part, with a
very substantial amount of lead inductance when mounted like that. For
good results, ideally you would have planes for power and ground on

adjacent
layers in the PCB under the chip. That allows you to put the decoupler
at
either end of the chip, and still retain low inductance. Adjacent
planes also
acts as a small but very good at HF capacitor.

Boris makes a good point about the size of the loop between probe tip
and
ground. You can get little socket adapters which you solder to the
board to
minimise this.

I still think you stand a fair chance of problems, when essentially you're doing your signal strength measurement in baseband and sweeping at rates in the same frequency range. The aquisition time for the signal strength measurement needs to be much shorter than the sweep, or the signal strength will change while you're attmpting to measure it.

I guess it's a bit like the problem of designing audio-derived AGC in direct conversion receivers. It takes too many cycles to measure the audio volume at low frequencies to get a correction signal to control gain. Similar problem. There might be a way of disentangling it in software, I don't know the mathematics but I can intuitively imagine that it could work.

But I'm no expert on this, just a clown with soldering iron...

That puts another angle on it. In that case I'd say you could produce a nice instrument by using a complete analogue analyser such as my design http://www.hanssummers.com/electronics/equipment/spectrumanalyser/index.htm or similar, and feeding the sweep (X-axis) and logarithmic output (Y-axis) into the PC via ADC's on the parallel port. 8-bit ADC's would probably be marginally good enough, 10 bit for sure.

>

It became a project in its own right for me. So much that it spawned a second project http://www.hanssummers.com/electronics/equipment/spectrumanalyser2/index.htm. But not wasted time - I learnt so much making it and got my first experience at VHF work etc, so it was time well spent.

I think a parallel port is easily fast enough for this application

>

True enough. I had this problem with a different project. There's a shareware driver available which helps access the parallel port under XP etc. See http://www.hanssummers.com/electronics/clocks/matrix/index.htm for details of how it works.

You might try using the schmitt trigger chip instead of an inverter.
Schmitt triggers are made for the purpose you are using the 7404 for. Can't
remember the 74XX number off hand, but a look through a Digi-Key catalog or
Mouser catalog will reveal it. Good luck with the project...

Hi again,
I'm looking for a schematic of a uhf-amplifier with a gain of about
10. It shoud give about 1 W output power (to a 50 Ohm Load) at about
100mW input at the (preferably 50 ohm) input (impedance).
The frequency to be amplified is about 440-450 MHz.
Please post links to circuits matching my requirements and generally
all uhf-amplifier design related links here or send me schematics via
e-mail: abcdstutNOFRICKINGSPAMzer@evard.ch

Thanks in advance.

Yes Sweep rate can be a problem, but it's all down the baseband bandwidth and what kind of update rate you want/need.

If you want to sweep across a 100MHz within say a second, assuming your using 44100 sampling rate, that's 44100 samples you'll get across the 100MHz sweep in that one second - 2.26Khz wide freq segments (non-overlapping), but you'd need a baseband bandwidth of 1KHz to overcome the anti-alias problem.

Doesn't sound to bad really. A one second scan across the entire 100MHz is fine really (depending on what your doing) - the PC is a perfect storage scope.

To convert a linear I/Q baseband sample to a log scale is no problem at all in software.

The software cud easily deal with any variation in VCO/Mixer level differences across the whole band.

Best to have the PC control the vco though, then as you say, you can zoom in on a desired freq range etc.

Many manufacturers of aluminum electrolytic caps recommend they be reformed
after 18 months of storage, others say 2 years, and others say 3 years.

The problem I'm having seeing how it can work is this. If you take 44100 measurements per second, that's one measurement every 27uS. But you've low pass filtered your baseband at 1KHz. It would take at least one of those cycles to measure the envelope amplitude with any degree of accuracy but you're allowing just 2.7% of a single 1KHz sample, how does that work? Or am I looking at it too simplistically?

I certainly agree that the PC can make a nice storage and display device, specially if 'scopes aren't so easily available. Seems to me a question of how much of the signal chain is implemented in analogue and how much in digital. I Just think it saves an awful lot of hassle to add that little extra analogue stage before you go digital, i.e. 2nd IF and detector. Log could be done on the digital side no problem if desired provided enough ADC resolution was available. VCO/Mixer level differences could still be compensated in software, and the PC control the VCO.

Hmmmmm... It's interesting to speculate that you could get all
excited about doing this, build the required equipment, use your old
spark transmitter and coherer, and be talking with someone who is
using just the same equipment at the other end, except that his
equipment is "virtual". That is, he just uses processing power to
emulate a spark transmitter's emissions...

;-)

Thanks, but no thanks. I'd rather enjoy the challenge of
communicating through all the degradations that happen to waves
propagated through the air. It doesn't bother me one way or the other
if others adopt the technique, though.

Cheers,
Tom

I have a vague recollection that one type of "tuner cleaner" actually included a small amount of a lightly-abrasive material, intended to clean oxidation and cigarette tar and etc. off of the contacts in old-style black-and-white television tuners. Some "tuner cleaner" products also include a lightweight oil to act as a residual lubricant. Then, there are the (preferred, IMHO) "zero-residue" contact cleaners.

>Hey, it worked for Nike, why not Radio Shack? I imagine they have

It should bother you, Tom. This guy's response to the BPL problem was to give us software that simulates being on the air. Not only is it contrary to the spirit and purpose of the hobby, but worst of all, it encourages us all to be discouraged. It gives the weakesat among us an easy out, at the cost of adding still more to the hobby's difficulties.

So far, the idea of using non-ham links in order to "improve" the performance of amateur radio has been 100% consistent. In every case where it has been applied, it has managed to set back and denigrate the hobby, to some extent or another.

I am sorry to hear that this invasion of non-ham stuff into the hobby does not bother you. It sure should.

Thats exactly what the guys were saying on the repeater the other day.

There was a foam pad with a gelled cleaner you put in the cover of
drum type TV tuners to wipe the contacts as they passed under the pad.
The were good on old, almost worn out tuners. The pad would last about
two years before it crumbled, and you had to service the tuner again.

Am I to understand that we are all going belly-up and cave in to BPL? Perhaps Mr. Stinson is trolling for the power companies. I, for one, have not given up the fight against BPL. Perhaps all the good Republican HAMS and SWLrs should write their congressmen and the President who has appointed the majority of the FCC and suggest that their right to the spectrum is on a par with that to bear arms. The FCC is effectively limiting our free speech by jamming our frequencies.

I view BPL as a means of restricting my access to shortwave freqs in much the same way the Chinese jam freqs from Nepal. But, of course, the present administration would never do anything to restrict our access to global views which may call their agenda into question.

I propose that we start sending electricity through our TV cables as a backup to our outdated electrical system. I am "putting down the marker" for PCTV, Power through Cable TV! We would only need one connection for our TVs, and VCRs.

Sorry Dave, your idea lacks the purity derived from the radio - ether - radio connection. Let's not divert our energy away from stopping BPL before it gets out of control. BTW, you wouldn't be a BPL advocate, would you?

I'm not discouraged. If BPL eats up the HF spectrum I'll be one of
those still able to communicate by listening to the CW signals change
the noise and copy the changes as code.
Don't laugh, I've done it before.
